2024 Workshop: Impact of Terrestrial Weather on the Space Weather of the ITM

Long title Impact of Terrestrial Weather on the Space Weather of the Ionosphere-Thermosphere-Mesosphere Grand Challenge Conveners **Jens Oberheide** Shantanab Debchoudhury Larisa Goncharenko Guiping Liu Sarah McDonald Fabrizio Sassi Jiarong Zhang Deepali Aggarwal Bjoern Bergsson Mack Jones Zishun Qiao joberhe@clemson.edu Description

Processes generated by terrestrial weather in the lower atmosphere (i.e., troposphere and stratosphere, altitudes less than ~50 km) are recognized by the scientific community as sources of variability in both the structure and composition of the ionosphere-thermosphere-mesosphere (ITM) region. The ITM is a confluence of energy and processes that interconnect Earth's atmosphere with space. Exposed to persistent wave forcing from terrestrial weather sources, and solar and magnetic forcing, the ITM is a domain of compelling scientific inquiry that connects thermodynamics, fluid dynamics, electrodynamics and plasma physics. Predicting its mean state and variability, the "space weather" is of significant national interest for space situation awareness including the very low earth orbit (VLEO) as the new frontier of space operations. Advancing the understanding of whole atmosphere interconnections between terrestrial and space weather requires coordinated modeling and observational efforts along with the implementation of new technologies across different spatial and temporal scales. Of particular interest are wave-induced vertical coupling processes that alter the ITM state in multiple ways, including their influence on structure, composition, circulation, and electrodynamics. Recent efforts through NASA's Living With a Star program and ISSI workshops, to name just a few, clearly show that progress has been made but that significant gaps in our understanding remain. This GC workshop aims to seek the expertise of the broader CEDAR community to help revealing the critical links between weather and space weather through addressing four specific goals.

1. Quantify the variability of relevant neutral and ionospheric state parameters on different spatio-temporal scales, from regional to global, and from hours to interannual to climate: what are the observational baseline data sets we have, what are the gaps and will future space-based and ground-based measurements be able to close those gaps.

2. Develop a set of metrics to evaluate data-model comparisons.

3. Evaluate state-of-the-art models across different spatio-temporal scales and assess the impact of data assimilation on model performance.

4. Identify the important mechanisms that connect terrestrial variability with space weather on daily, sub-seasonal, inter-annual scales; examine how they vary with altitude and geographic regions.

Agenda

Monday, 1:30 - 3:30, Pacific A&B

1:30 - 1:45 Federico Gasperini (invited), Ultra-Fast Kelvin Wave Packets and their lonosphere-Thermosphere Impacts – ICON & COSMIC-2 Perspectives

1:45 - 2:00 Maosheng He, Diverse Nonlinear Interactions of Planetary-Scale Waves Diagnosed in Mesospheric Winds at 52°N Latitude Observed Across Two Longitudinal Sectors

2:00 - 2:15 Manbharat Dhadly, Short-term to Inter-annual Variability of the Non-migrating Tide DE3 from MIGHTI, SABER, and TIDI: Potential Tropospheric Sources and Ionospheric Impacts

2:15 - 2:30 Sophie Philips, Localized Vertical Wave Coupling From the Stratosphere to the Ionosphere

2:30 - 2:45 Dupinder Singh, *Empirical modelling of NmF2 using FISM2*

2:45 - 3:00 Shunrong Zhang, Observing Ionospheric variability with the Millstone Hill Incoherent Scatter Radar Long-Duration Experiment

3:00 - 3:15 Valery Yudin, Global Scale and Mesoscale Dynamics in the Space Weather Oriented Models: Retrospective Analysis and Observational Constraints

3:15 - 3:30 Esayas Shume, The Nasa Space Weather R2O2R Program: New Approaches

Wednesday, 10:00 - 12:00, Pacific A&B

10:00 - 10:15 Xian Lu (invited), *Ionosphere-Thermosphere variability driven by gravity waves, tides, and connection to magnetospheric forcing*

10:15 - 10:30 Chris Krier, Seasonal Variability of the DE3 and DE2 Non-Migrating Tides in Middle Thermospheric Temperature and Composition during October 2018-August 2021 as Revealed by GOLD

10:30 - 10:45 Jeff Forbes, Responses of the Mean Thermosphere Circulation, O/N ₂Ratio and Ne to Solar and Magnetospheric Forcing From Above and Tidal Forcing From Below

10:45 - 11:00 Doug Rowland, *GDC*+*DYNAMIC*: a strategic hub for the ITM Great Observatory, linking terrestrial weather and space weather

11:00 - 11:15 Guiping Liu, Temperatures simulated by WACCM-X with NAVGEM-HA meteorological analyses and compared to SABER

11:15 - 11:30 Sovit Khadka, Topside Ionospheric Response to Wave Driving in the Lower Atmosphere

11:30 - 11:45 Shibaji Chakraborty, Impact of convective source-generated MSTIDs on skywaves at middle latitude North American sector observed using SuperDARN HF radar

11:45 - 12:00 Biff Williams, The CGWaveS aircraft campaign to measure thunderstorm generated gravity waves in the stratosphere and mesosphere

File upload <u>GC intro talk during plenary</u> (4.87 MB) Justification

The workshop goals are not only at the heart of CEDAR's coupling and system science spirit but will also help to define more clearly the state-of-the-art in the light of future EZIE, DYNAMIC and GDC missions. Moreover, this workshop will provide an opportunity for NSF/CEDAR ground-based observatories to join forces with a broader community to synergistically enable a transformed view of terrestrial weather-space weather connection.
