Description

This workshop will highlight recent discoveries in equatorial aeronomy along with new developments in experimental, theoretical, and computational methods that make them possible. The focus will be on observations and research at the Jicamarca Radio Observatory. Results obtained from closely-related projects and instrumentation, including regional radio/radar networks, are also welcome. The session will combine a few review presentations with a number of science highlights.

Agenda

Danny Scipion: "Jicamarca Radio Observatory: Updates"

Marcos Inoñan: "J-ARGUS: An update on the efforts towards a tristatic radar capability"

Meers Oppenheim: "Questions about and new investigations of 150 km Echoes: Looking at these waves from multiple directions simultaneously"

Carla Arce-Tord: "Developing a Calibration Pipeline: Antenna Module Phase Calibration for the LWA-Perú Array"

Alex Massoud: "Studies of post-midnight ESF over Jicamarca using two-dimensional radar observations"

Isaac Wright: "Estimating low-latitude scintillation pattern orientations using a local array of sensors at Jicamarca"

Aaron Kirchman: "Regional Simulations of Equatorial F-Region Interchange Instabilities Driven with Medium Power ISR"

Cesar Valladares: "The LISN Network and Its Use to Understand and Forecast ESF Irregularities"

Jorge (Koki) Chau: ""

## Justification

Three recent developments prompt this workshop. One is a series of upgrades at Jicamarca that will fundamentally alter and expand its capabilities. Among these are new medium-power solid-state transmitters that will allow perpetual incoherent scatter measurements and fully- implemented automatic beam steering that will allow the fast reconfiguration of experiments. Also, the deployment of two LWA-type radio arrays in Peru will support and augment the capabilities of the Jicamarca radar while facilitating novel investigations bridging aeronomy and astronomy. Finally, the recently announced NASA sounding rocket campaign to take place in Peru in 2028 opens the possibility of additional synergistic projects and discoveries.

In this workshop, we will describe and discuss these new developments so that they can be fully exploited by the community.

Related to CEDAR Science Thrusts:

Encourage and undertake a systems perspective of geospace

Explore exchange processes at boundaries and transitions in geospace

Develop observational and instrumentation strategies for geospace system studies

Fuse the knowledge base across disciplines in the geosciences

Manage, mine, and manipulate geoscience/geospace data and models

Workshop format

Short Presentations

Include a virtual component?

No

Keywords

equatorial aeronomy, remote sensing, radio science, space weather
