

CCSM4 / CESM1 Tutorial

CCSM Software Engineering Group
Updated July 7, 2010

CCSM 4.0 release, April 1, 2010

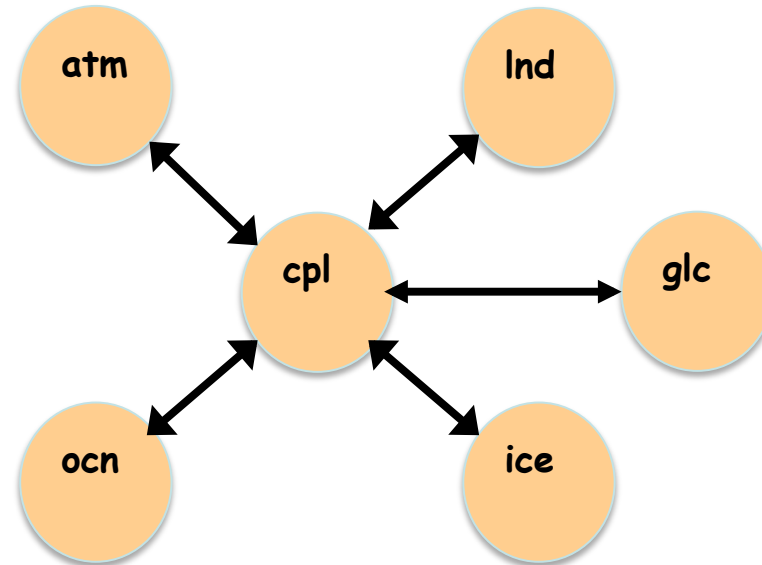

CESM 1.0 release June 25, 2010

Outline

- What is CESM?
- Release Homepage on Web
- Software & Hardware Requirements
- Basic Work Flow
- One-Time Setup
 - Registration and Source Code Download
 - Create an Input Data Root Directory
 - Porting
- Creating & Running a Case
 - Create a New Case
 - Configure the Case
 - Build the Executable
 - Initial Run and Output Data
 - Continuation Runs
- Getting More Help
- Appendix

What is CESM?

- Community Earth System Model (CESM) is a coupled climate model used for basic climate research, contributions to IPCC reports, and hindcasts and forecasts of past, present, and future climates.
- Consists of 4+ geophysical component models (atmosphere, land, ocean, sea ice) *on potentially different grids* that exchange *boundary data* with each other **only** via communication with a coupler (hub and spoke architecture)

- The component is a basic element throughout CESM
 - Directory Structures
 - Plug and Play Components (ie atm) with different Models (ie cam, datm, etc)
 - Configuration Setup

Release Homepage on Web

ABOUT CESM 1.0

The Community Earth System Model (CESM) is a coupled climate model for simulating the earth's climate system. Composed of four separate models simultaneously simulating the earth's atmosphere, ocean, land surface and sea-ice, and one central coupler component, the CESM allows researchers to conduct fundamental research into the earth's past, present and future climate states. Please see the brief overview of the [notable model improvements](#).

MODEL OUTPUT DATA AND DIAGNOSTICS

- Model Output Diagnostic Plots
- Model Output Data (ESG)
- Post-Processing Utilities

External Library Documentation

- Parallel I/O Library (PIO)
- Model Coupling Toolkit (MCT)
- Earth System Modeling Framework (ESMF)

MODEL INPUT DATA

The input data necessary to run all supported component sets is made available from a public [Subversion input data repository](#). Note that the inputdata repository has much more data in it than you need to run CESM 1.0--- **DO NOT attempt to svn checkout the whole input data repository**. The CESM 1.0 User's Guide explains how to obtain the subset of input data required for your needs.

PERFORMANCE AND LOAD BALANCING DATA

The [CESM1 Timing Table](#) provides performance data that will continue to evolve due to changes in the model, machine hardware and input from the user community.

CESM PROJECT

The Community Earth System Model (CESM) is a fully-coupled, global climate model that provides state-of-the-art computer simulations of the Earth's past, present, and future climate states.

CESM is sponsored by the National Science Foundation (NSF) and the U.S. Department of Energy (DOE). Administration of the CESM is maintained by the Climate and Global Dynamics Division (CGD) at the National Center for Atmospheric Research (NCAR).

MODEL SOURCE CODE

Copyright and Terms of Use

All CESM source code is subject to the following [Copyright Notice and Disclaimer](#).

Acquiring the Code

CESM source code is distributed through a public Subversion code repository. This code can be checked out using Subversion client software, such as the command tool svn, or simply viewed with a web browser.

A short [registration](#) is required to access the repository. After registering, you will receive an email containing a user name and password that is necessary to gain access to the repository.

Acquisition of the code is more fully described in the [CESM 1.0 User's Guide](#).

Version Summaries and Known Problems

The following table lists the available versions of code along with their test record and any known problems in the code.

- CESM 1.0 Release Versions

Reporting a Problem

If you have any problems, please first read the User's Guide including the sections on FAQs and Use Cases. Please also refer to the [CESM Bulletin Board](#), which is in place to facilitate communication within the CESM community. Finally, please also refer to the [Known Problems](#) entries that are provided with every release and release update. If questions or problems still exist, then please send an email to cesm-help@cgd.ucar.edu. Support questions will be answered as resources are available.

©2010 UCAR | Privacy Policy | Terms of Use | Contact Us | Sponsored by NSF | Managed by UCAR | Webmaster

The National Center for Atmospheric Research is sponsored by the National Science Foundation. Any opinions, findings and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation.

Software & Hardware Requirements

- Subversion client (version 1.4.2 or greater)
- Fortran and C compilers (recommend pgi, intel, or ibm xlf compilers)
- Netcdf library (recommend netcdf3.6.x)
- MPI (MPI1 is adequate, openmpi or mpich seem to work on linux clusters)

- CESM currently runs on “out of the box” today on the following machines
 - bluefire – NCAR IBM AIX
 - jaguar and jaguarpf – ORNL Cray XT4 and XT5
 - franklin and hopper – NERSC Cray XT4 and XT5
 - kraken – NICS Cray XT5
 - intrepid – ANL IBM Bluegene/P
 - edinburgh – NCAR linux cluster
 - hadley – LBL linux cluster
 - midnight – ARSC Sun cluster
 - brutus – ETH linux cluster with pgi/openmpi, pgi/mpich, intel/openmpi, or intel/mpich
 - and a few others

Basic Work Flow

- One-Time Setup Steps
 - (A) Registration and Download
 - (B) Create an Input Data Root Directory
 - (C) Porting

- Creating & Running a Case
 - (1) Create a New Case
 - (2) Configure the Case
 - (3) Build the Executable
 - (4) Running the Model: Initial Run and Output Data
 - (5) Running the Model: Continuation Runs

(A) Registration

- Go to cesm1.0 home page: <http://www.cesm.ucar.edu/models/cesm1.0/>
- Right hand column has a link to the registration page, click on it
- Register -- you will be emailed a username and password to access the repository

Community Earth System Model

CESM1.0 Release User Registration

Required Fields

Last Name:

First Name:

E-Mail:

Institution:

Purpose:

Valid special characters to use:
., - , ' , / , forward slash , : , colon , commas. No additional special characters are allowed.

(Maximum characters: 400)
You have 400 characters left.

Have you used previous versions of CCSM/CESM? Yes No

Publications using previous versions of CCSM/CESM:

If you have used previous versions of CCSM/CESM, please provide publications you have using the code.

Valid special characters to use:
., - , ' , / , forward slash , : , colon , commas. No additional special characters are allowed.

(Maximum characters: 600)
You have 600 characters left.

Copyright and Terms of Use

The Community Earth System Model (CESM) was developed in cooperation with the National Science Foundation (NSF), the Department of Energy (DOE) the National Aeronautics and Space Administration (NASA), the University Corporation for Atmospheric Research (UCAR) and the National Center for Atmospheric Research (NCAR). Except for the segregable components listed in the copyright, CCSM is public domain software. There are third party tools and libraries that are embedded and they are subject to their own copyright notices and terms.

Please read the [Copyright and Terms of Use](#) on the CESM1.0 release home page.

Access to the Model

Once you agree to the Copyright and Terms of Use and submit your user information, you will be contacted via email with a subversion repository user name and password. This user name and password will allow you to access the source code.

Agree to Terms Yes No

(A) Download the Source Code

- Code and input datasets are in a subversion repository (get subversion at <http://subversion.apache.org/>)
- Do NOT download any input data

> `svn list --username guestuser https://svn-ccsm-release.cgd.ucar.edu/model_versions`

(A) Overview of Directories (initial model download)

Next Step In the Basic Work Flow

- One-Time Setup Steps
 - (A) Registration and Download
 - (B) Create an Input Data Root Directory**
 - (C) Porting

- Creating & Running a Case
 - (1) Create a New Case
 - (2) Configure the Case
 - (3) Build the Executable
 - (4) Running the Model: Initial Run and Output Data
 - (5) Running the Model: Continuation Runs

(B) Create an Inputdata Root Directory

- The inputdata area contains the input data required to run the model
- On supported machines the inputdata directory already exists with all necessary data
- Location specified in the scripts by the \$DIN_LOC_ROOT_CSMDATA variable in env_run.xml

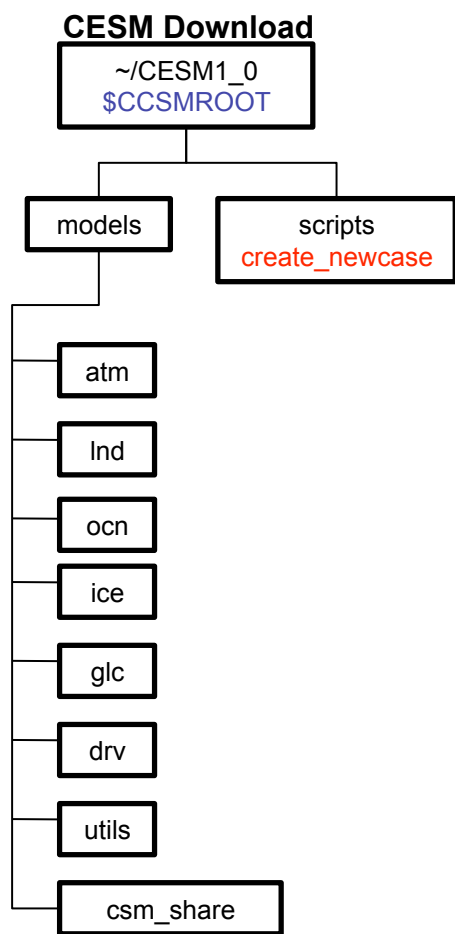

- On non-supported machines you will need to create an inputdata root directory and add the data
- Ideally this directory is shared by a group of users to save disc space
- Initially the inputdata directory contains no data, it will be added later on an as-needed basis
- **Do NOT download input data manually** (ie. by using svn co)
- The script `check_input_data` is used to download data into the inputdata
- The script `check_input_data...`
 - checks if the necessary data is already available in the inputdata dirctory
 - downloads only the data needed for a particular run (more later)
 - puts the data in the proper subdirectories
 - creates the proper subdirectories if necessary

- **Do NOT download input data manually**

(B) Overview of Directories (+ inputdata directory)

INPUTDATA Directory

/fs/cgd/csm/inputdata
\$DIN_LOC_ROOT

Next Step In the Basic Work Flow

- One-Time Setup Steps
 - (A) Registration and Download
 - (B) Create an Input Data Root Directory
 - (C) Porting**
- Creating & Running a Case
 - (1) Create a New Case
 - (2) Configure the Case
 - (3) Build the Executable
 - (4) Running the Model: Initial Run and Output Data
 - (5) Running the Model: Continuation Runs

(C) Porting

- Porting is beyond the scope of this presentation
- On supported machines, no porting is necessary
- See the User's Guide for a list of supported machines
- See the User's Guide for help on porting to a new machine
- See the Appendix for a few tips on how to port
- If the new machine is similar to a supported machine, porting can be relatively easy
- Porting might also be quite difficult – a lot depends on the specifics of your machine

Work Flow: Super Quick Start

These unix commands built and ran the model on a supported machine named "bluefire"

```
# go to root directory of source code download
cd /path/to/source/code/download/cesml_0/

# go into scripts subdir
cd scripts

# (1) create a new case in your home dir
create_newcase -case ~/mycase.01 -res f19_g16 -compset B_1850 -mach bluefire

# go into the case you just created in the last step
cd ~/mycase.01/

# (2) configure the case
configure -case

# (3) build the executable
mycase.01.bluefire.build

# (4) submit an initial run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
source Tools/ccsm_getenv
ls -lFt $RUNDIR
ls -l logs

# when the initial run finishes, change to a continuation run
xmlchange -file env_run.xml -id CONTINUE_RUN -val TRUE

# (5) submit a continuation run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
ls -lFt $RUNDIR
ls -l logs
```

Next Step In the Basic Work Flow

- One-Time Setup Steps
 - (A) Registration and Download
 - (B) Create an Input Data Root Directory
 - (C) Porting

- Creating & Running a Case
 - (1) Create a New Case**
 - (2) Configure the Case
 - (3) Build the Executable
 - (4) Running the Model: Initial Run and Output Data
 - (5) Running the Model: Continuation Runs

Work Flow: Super Quick Start

These unix commands built and ran the model on a supported machine named "bluefire"

```
# go to root directory of source code download
cd /path/to/source/code/download/cesml_0/

# go into scripts subdir
cd scripts

# (1) create a new case in your home dir
create_newcase -case ~/mycase.01 -res f19_g16 -compset B_1850 -mach bluefire

# go into the case you just created in the last step
cd ~/mycase.01/

# (2) configure the case
configure -case

# (3) build the executable
mycase.01.bluefire.build

# (4) submit an initial run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
source Tools/ccsm_getenv
ls -lFt $RUNDIR
ls -l logs

# when the initial run finishes, change to a continuation run
xmlchange -file env_run.xml -id CONTINUE_RUN -val TRUE

# (5) submit a continuation run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
ls -lFt $RUNDIR
ls -l logs
```

(1) Create a New Case

- First step in setting up a model run is running the script `create_newcase`
- Go to the scripts directory: `.../CESM1_0/scripts/`
- `create_newcase` is the tool that generates a new CESM1 case
- Scripts are a combination of `csh`, `perl`, `sh`, and `xml`.

```
CESM1_0/scripts>ls -l

`create_newcase`

(1) About create_newcase

- create_newcase has many command line options, most are rarely used
- create_newcase -help lists all the available options
- Most often only four options are used: case, compset, res, and mach

```
CESM1_0/scripts>./create_newcase -help
SYNOPSIS
  create_newcase [options]
OPTIONS
  User supplied values are denoted in angle brackets (<>). Any value that contains
  white-space must be quoted. Long option names may be supplied with either single
  or double leading dashes. A consequence of this is that single letter options may
  NOT be bundled.

  -case <name>           Specifies the case name (required).
  -compset <name>        Specify a CESM compset (required).
  -res <name>            Specify a CCSM grid resolution (required).
  -mach <name>           Specify a CESM machine (required).
  -pecount <name>        Value of S,M,L,X1,X2 (optional). (default is M).
  -pes_file <name>       Full pathname of pes setup file to use (will overwrite default settings) (optional).
  -compset_file <name>  Full pathname of compset setup file to use. (optional)

  -help [or -h]         Print usage to STDOUT (optional).
  -list                 Only list valid values for compset, grid settings and machines (optional).
  -silent [or -s]      Turns on silent mode - only fatal messages issued (optional).
  -verbose [or -v]     Turn on verbose echoing of settings made by create_newcase (optional).
  -xmlmode <name>       Sets format of xml files; normal or expert (optional). (default is normal)

  The following arguments are required for a generic machine. Otherwise, they will be ignored.

  -scratchroot <name>   ccsm executable directory (EXEROOT will be scratchroot/CASE) (char)
  -din_loc_root_csmdata <name> cesm input data root directory (char)
  -max_tasks_per_node <value> maximum mpi tasks per machine node (integer)

  The following two arguments turn on single point mode.
  If one is given -- both MUST be given.

  -pts_lat <value>      Latitude of single point to operate on (optional)
  -pts_lon <value>      Longitude of single point to operate on (optional)
```

(1) create_newcase -- Four Required Arguments

- `./create_newcase -case ~/cases/mycase1 -res f19_g16 -compset B_1850_CN -mach bluefire`
- “case” is the name and location of the case being created (eg. `~/cases/mycase1`)
- “res” specifies the model resolutions (or grid)
 - Format is [atm/lnd grid]_[ocn/ice grid], eg. `f19_g16` is 1.9x2.5 atm/lnd + `gx1v6` ocn/ice
 - Most often the atm & lnd share the same grid, and the ice & ocn share the same grid
 - Equivalent short and long names (`f19_g16 == 1.9x2.5_gx1v6`)
- “compset specifies the “component set”, ie. which component models to use
 - Eg. “B” compsets use all active models
 - Eg. “F” compsets use active atmosphere, land, and ice, but data ocean model
 - Equivalent short and long names (`B1850CN == B_1850_CN`)
- “mach” specifies the machine that will be used.
 - “supported” machines like bluefire, jaguar, franklin, intrepid
 - “prototype” machines that are not tested regularly, eg. `prototype_frost`
 - “generic machines” provide a starting point for porting, eg. `generic_ibm`
- `Create_newcase -list` will list all the valid choices for these command line options (see next slide)
- Once these values are set on the command line, they cannot be changed, they are “locked down”
- The file `env_case.xml` contains all the things that were “locked down” when `create_newcase` was run

(1) Valid Values for res, compset, and mach

```
CESM1_0/scripts>./create_newcase -list

RESOLUTIONS:  name (shortname)
0.9x1.25_0.9x1.25 (f09_f09)
0.9x1.25_gx1v6 (f09_g16)
1.9x2.5_1.9x2.5 (f19_f19)
1.9x2.5_gx1v6 (f19_g16)
4x5_gx3v7 (f45_g37)

COMPSETS:  name (shortname): description (status)
A_PRESENT_DAY (A)
  Description: All data model
B_2000 (B)
  Description: All active components, present day
B_1850 (B1850)
  Description: All active components, pre-industrial
B_1850_CN (B1850CN)
  Description: all active components, pre-industrial, with CN (Carbon Nitrogen) in CLM
F_AMIP (FAMIP)
  Description: Default resolution independent AMIP is INVALID
F_2000_CN (FCN)
  Description: Stand-alone cam default, prescribed ocn/ice with CN
G_NORMAL_YEAR (G)
  Description: Coupled ocean ice with COREv2 normal year forcing
I_2000 (I)
  Description: Active land model with QIAN atm input data for 2003 and Satellite phenology (SP), CO2 level
  and Aerosol deposition for 2000
I_1850 (I1850)
  Description: Active land model with QIAN atm input data for 1948 to 1972 and Satellite phenology (SP), CO2
  level and Aerosol deposition for 1850

MACHINES:  name (description)
bluefire (NCAR IBM p6, os is AIX, 32 pes/node, batch system is LSF)
franklin (NERSC XT4, os is CNL, 4 pes/node, batch system is PBS)
intrepid (ANL IBM BG/P, os is BGP, 4 pes/node, batch system is cobalt)
jaguar (ORNL XT4, os is CNL, 4 pes/node, batch system is PBS)
jaguarpf (ORNL XT5, os is CNL, 12 pes/node, batch system is PBS)
prototype_ranger (TACC Linux Cluster, Linux (pgi), 1 pes/node, batch system is SGE)
generic_linux_pgi (generic linux (pgi), os is Linux, batch system is PBS, user-defined)
generic_linux_intel (generic linux (intel), os is Linux, batch system is PBS, user-defined)
```

(1) Running create_newcase

```
CESM1_0/scripts>./create_newcase -case ~/cases/mycase1 -res f19_g16 -compset B -mach bluefire

*****
* CCSM has significant flexibility to configure cases
* with respect to components, grids, and model settings.
* This version of CCSM has only be validated scientifically
* for the following full active configurations:
*
* 1.9x2.5_gx1v6   B_1850_CN
* 1.9x2.5_gx1v6   B_1850_RAMPCO2_CN
* 0.9x1.25_gx1v6  B_1850_CN
* 0.9x1.25_gx1v6  B_1850_RAMPCO2_CN
*
* If the user is interested in running a "stand-alone"
* component configuration, the following model
* configurations have been validated scientifically
* have associated diagnostic output as part of the release.
*
* 0.9x1.25_gx1v6  F_AMIP_1DEG
* 1.9x2.5_gx1v6   F_AMIP_2DEG
* 0.9x1.25_gx1v6  I and ICN
* T62_gx1v6       C
*
* Please refer to the individual component release
* web pages for information regarding alternative
* component configurations.

- Contain variables used by scripts -- some can be changed by the user
- Here's a snippet of the env_run.xml file

```
<!--"sets the run length in conjunction with STOP_N and STOP_DATE, valid values: none,never,nstep,nstep,nseconds,nsecond,nminutes,nminute,nhours,nhour,ndays,nday,nmonths,nmonth,nyears,year,date,ifdays0,end (char) " -->
<entry id="STOP_OPTION" value="ndays" />

<!--"sets the run length in conjunction with STOP_OPTION and STOP_DATE (integer) " -->
<entry id="STOP_N" value="5" />

<!--"logical to turn on short term archiving, valid values: TRUE,FALSE (logical) " -->
<entry id="DOUT_S" value="TRUE" />

<!--"local short term archiving root directory (char) " -->
<entry id="DOUT_S_ROOT" value="/ptmp/$CCSMUSER/archive/$CASE" />
```

- "id" is the variable name
- "value" is the variables name's setting
- <!-- text --> is a comment in xml
- Most variables have a description (above the entry)
- "(type)" is the type of the variable
- "valid values" indicates the full set of allowable settings
 - the scripts will let you know if you try to set a variable to an invalid value
 - many values do not have valid values defined, that means there are no constraints
- Use xmlchange to modify env variable settings
 - > xmlchange -help
 - > xmlchange -file env_run.xml -id STOP_N -val 20
- Or edit env_*.xml file manually -- but be careful about introducing formatting errors
- Use source to set your local environment with the case variable settings
 - > source ./Tools/ccsm_getenv

(* About .xml Files: How They Change the Build and Run

- Defaults are generally reasonable
- **env_case.xml** is set by create_newcase and cannot be modified
- **env_conf.xml** variables specify various component information
 - Most often this file should not be modified
 - RUN_TYPE, RUN_STARTDATE, RUN_REFCASE, RUN_REFDATE – defines initial conditions
 - Can change the physics of a model – be very careful about this
- **env_mach_pes.xml** variables specify the layout of components on hardware processors
 - Is used to tune the performance of the model
 - Scientific results do not depend on component/processor layout
 - NTASKS_* - number of mpi tasks assigned to the component
 - NTHRDS_* - number of openmp threads per mpi task for the component
 - ROOTPE_* - global mpi task rank of the component root mpi task
- **env_build.xml** variables specify some build information
 - Most often this file should not be modified
- **Macros.*** specifies the compilation variables used in the Makefile
 - Most often this file should not be modified
 - Can change compiler options, libraries, etc.
- **env_run.xml** variables specify run time information
 - Most often this file *will be* modified
 - STOP_OPTION, STOP_N, REST_OPTION, REST_N

```
<entry id="NTASKS_ATM" value="64" />
<entry id="NTHRDS_ATM" value="1" />
<entry id="ROOTPE_ATM" value="0" />

<entry id="NTASKS_LND" value="64" />
<entry id="NTHRDS_LND" value="1" />
<entry id="ROOTPE_LND" value="0" />

<entry id="NTASKS_ICE" value="64" />
<entry id="NTHRDS_ICE" value="1" />
<entry id="ROOTPE_ICE" value="0" />

<entry id="NTASKS_OCN" value="64" />
<entry id="NTHRDS_OCN" value="1" />
<entry id="ROOTPE_OCN" value="0" />

<entry id="NTASKS_CPL" value="64" />
<entry id="NTHRDS_CPL" value="1" />
<entry id="ROOTPE_CPL" value="0" />
```

Next Step In the Basic Work Flow

- One-Time Setup Steps
 - (A) Registration and Download
 - (B) Create an Input Data Root Directory
 - (C) Porting

- Creating & Running a Case
 - (1) Create a New Case
 - (2) Configure the Case**
 - (3) Build the Executable
 - (4) Running the Model: Initial Run and Output Data
 - (5) Running the Model: Continuation Runs

Work Flow: Super Quick Start

These unix commands built and ran the model on a supported machine named "bluefire"

```
# go to root directory of source code download
cd /path/to/source/code/download/cesml_0/

# go into scripts subdir
cd scripts

# (1) create a new case in your home dir
create_newcase -case ~/mycase.01 -res f19_g16 -compset B_1850 -mach bluefire

# go into the case you just created in the last step
cd ~/mycase.01/

# (2) configure the case
configure -case

# (3) build the executable
mycase.01.bluefire.build

# (4) submit an initial run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
source Tools/ccsm_getenv
ls -lFt $RUNDIR
ls -l logs

# when the initial run finishes, change to a continuation run
xmlchange -file env_run.xml -id CONTINUE_RUN -val TRUE

# (5) submit a continuation run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
ls -lFt $RUNDIR
ls -l logs
```

(2) Configure the Case

- Step (2) is to “configure” the case using the configure script
- Can modify env_conf.xml and env_mach_pes.xml before running configure, but not after
- Most often there is no need to modify env_conf.xml or env_mach_pes.xml
- Run configure -case
- Generates Buildconf directory with buildnml, buildexe, and input_data_list files
- Generates the case .build and .run scripts
- Locks env_conf.xml and env_mach_pes.xml

```
CESM1_0/scripts> cd ~/cases/mycase1
cases/mycase1>ls -l
total 64
drwxr-xr-x  2 userx  ncar      8192 May 13 14:32 LockedFiles
-rw-r--r--  1 userx  ncar     10687 May 13 14:32 Macros.bluefire

-rwxr-xr-x  1 userx  ncar     2199 May 13 14:32 env_mach_specific
-rw-r--r--  1 userx  ncar    10466 May 13 14:32 env_run.xml
-rwxr-xr-x  1 userx  ncar    10388 May 12 11:33 xmlchange
```

The diagram shows two red arrows pointing from boxes on the right to the terminal output. The first arrow points from a box labeled 'configure' to the 'configure' entry in the file listing. The second arrow points from a box labeled 'env_conf.xml' and 'env_mach_pes.xml' to the 'env_conf.xml' and 'env_mach_pes.xml' entries in the file listing.

(2) About configure

> *configure -help*

NAME

`configure` - configures the model for a given resolution, component set and machine.

SYNOPSIS

`configure [-case] [-cleannamelist] [-cleanmach] [-cleanall]`

- *configure -case*
 - Generates Buildconf directory and buildnml, buildexe, and input_data_list files
 - Generates the case .build and .run scripts
 - Locks env_conf.xml and env_mach_pes.xml
- *configure -cleanall*
 - Unlocks env_conf.xml and env_mach_pes.xml
 - “Backs up” Buildconf and run scripts
 - Ban modify env_conf.xml and env_mach_pes.xml and type `configure -case` again

(2) Running configure

```
cases/mycase1>./configure -case
Generating resolved namelist, prestage, and build scripts
adding use_case 2000_control defaults for var sim_year with val 2000
adding use_case 2000_control defaults for var sim_year_range with val constant
adding use_case 2000_control defaults for var use_case_desc with val Conditions to simulate 2000 land-use
configure done.
Successfully generated resolved namelist, prestage, and build scripts
Locking file env_conf.xml
Generating clean_build script
Generating build script
Generating run script
Locking file env_mach_pes.xml
Successfully configured the case for bluefire
If an old build exists for this case, you might want to
run the *.clean_build script before building
```

Generated Buildconf files

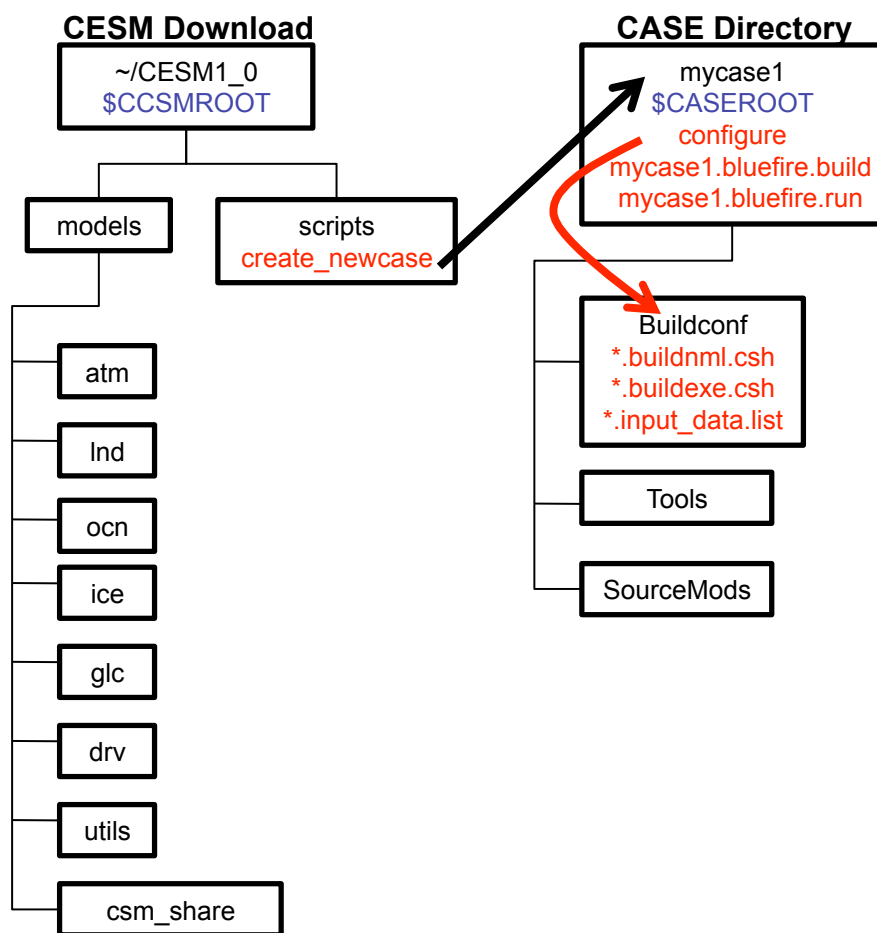

Generated build
and run scripts

Success

(2) Overview of Directories (+ configure)

INPUTDATA Directory

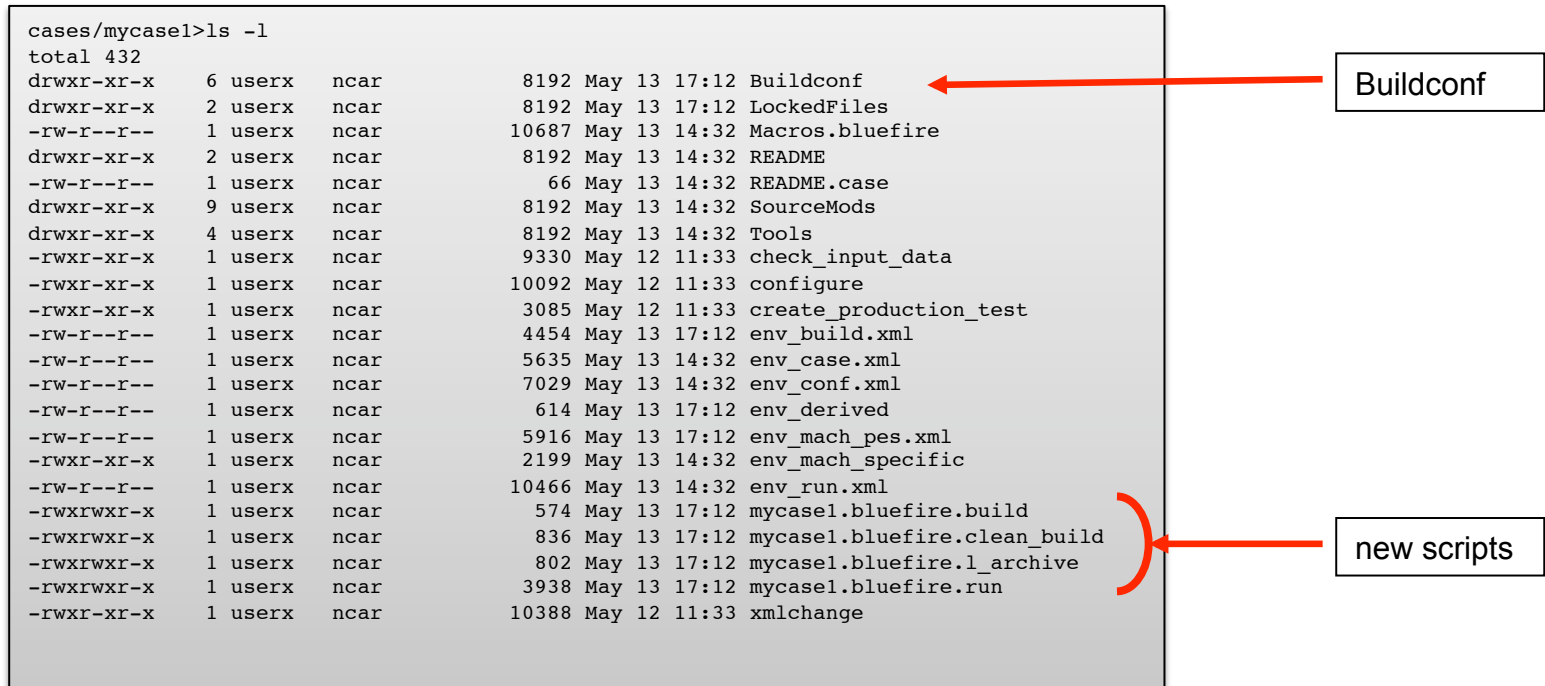

/fs/cgd/csm/inputdata
\$DIN_LOC_ROOT

(2) Case Dir After Running configure

- configure adds the Buildconf directory and populates it
- configure generates build, clean_build, run, and archive scripts

```
cases/mycase1>ls -l

```

Next Step In the Basic Work Flow

- One-Time Setup Steps
 - (A) Registration and Download
 - (B) Create an Input Data Root Directory
 - (C) Porting

- Creating & Running a Case
 - (1) Create a New Case
 - (2) Configure the Case
 - (3) Build the Executable**
 - (4) Running the Model: Initial Run and Output Data
 - (5) Running the Model: Continuation Runs

Work Flow: Super Quick Start

These unix commands built and ran the model on a supported machine named "bluefire"

```
# go to root directory of source code download
cd /path/to/source/code/download/cesml_0/

# go into scripts subdir
cd scripts

# (1) create a new case in your home dir
create_newcase -case ~/mycase.01 -res f19_g16 -compset B_1850 -mach bluefire

# go into the case you just created in the last step
cd ~/mycase.01/

# (2) configure the case
configure -case

# (3) build the executable
mycase.01.bluefire.build

# (4) submit an initial run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
source Tools/ccsm_getenv
ls -lFt $RUNDIR
ls -l logs

# when the initial run finishes, change to a continuation run
xmlchange -file env_run.xml -id CONTINUE_RUN -val TRUE

# (5) submit a continuation run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
ls -lFt $RUNDIR
ls -l logs
```

(3) Build the Model

- Step (3) is to “build” the model using the *.build script
- Can change values in env_build.xml before running *.build, but not after
- Most often there is no need to edit env_build.xml
- May want to introduce modified source code before building
- .build script creates build/run directory that will contain executable code and model namelist files
- Locks env_build.xml
- Builds the individual component libraries and then final executable

- Build script also checks for missing input data by running `check_input_data -check`
- If any inputdata is missing...
 - The build will abort, but it will provide a list of missing files
 - You must run the script `check_input_data -export` to acquire missing data
 - `check_input_data` will use svn to put required data in the inputdata directory
 - You must re-run build script after running `check_input_data`

(3) The .build script

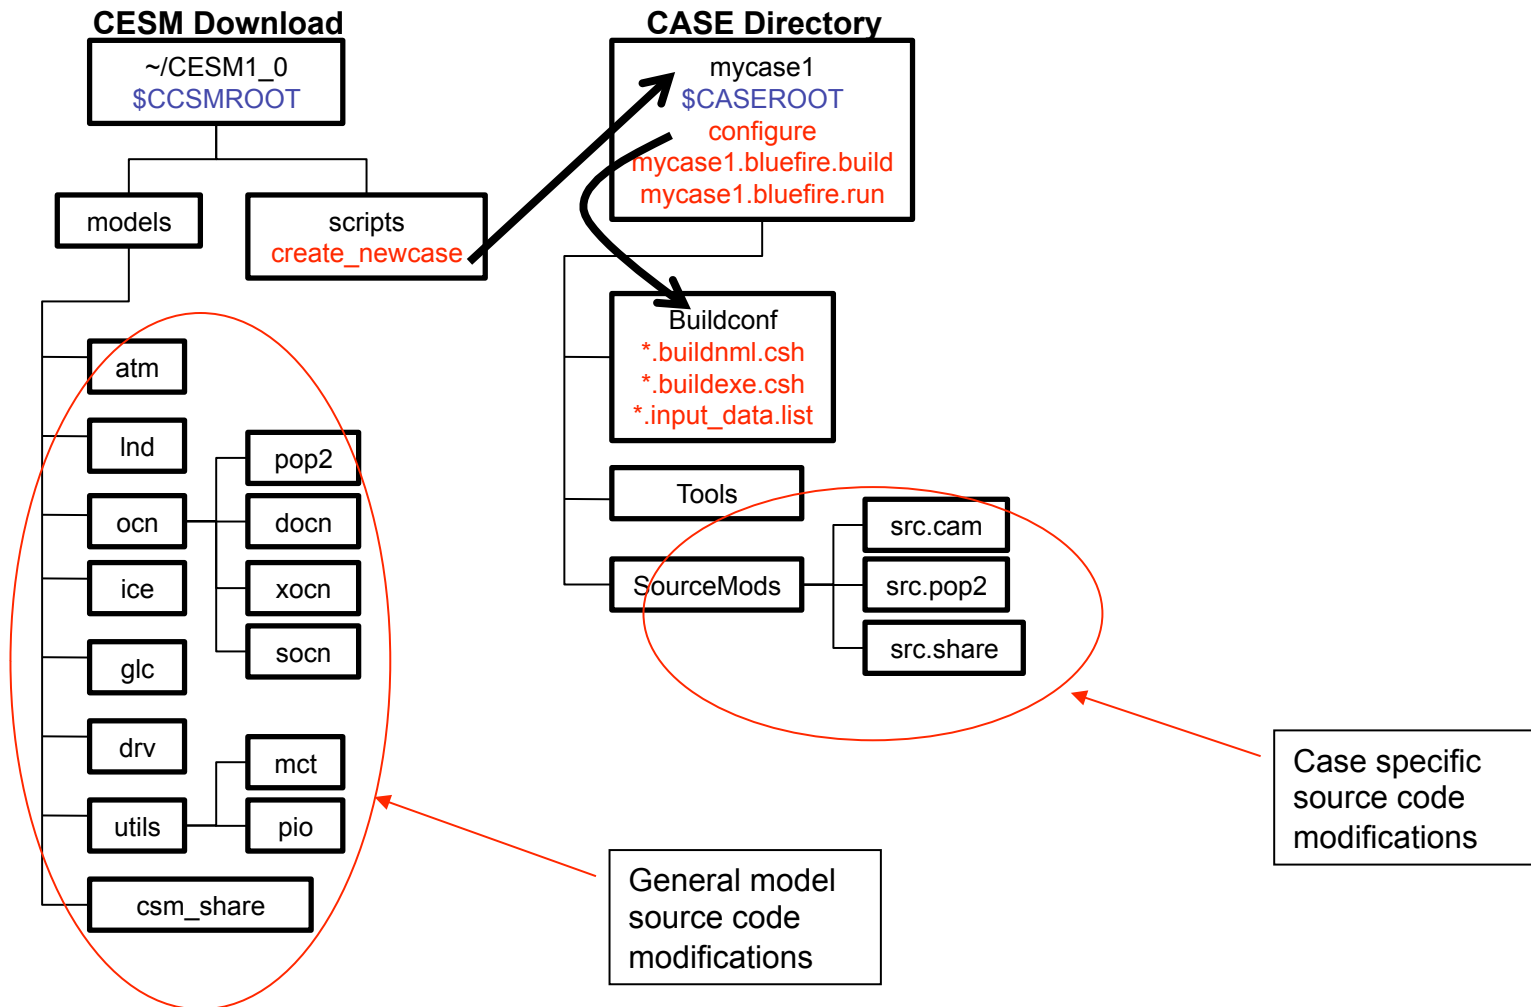

```
cases/mycase1>ls -l
total 432
drwxr-xr-x   6 userx  ncar      8192 May 13 17:12 Buildconf
drwxr-xr-x   2 userx  ncar      8192 May 13 17:12 LockedFiles
-rw-r--r--   1 userx  ncar    10687 May 13 14:32 Macros.bluefire
drwxr-xr-x   2 userx  ncar      8192 May 13 14:32 README
-rw-r--r--   1 userx  ncar      66 May 13 14:32 README.case
drwxr-xr-x   9 userx  ncar      8192 May 13 14:32 SourceMods
drwxr-xr-x   4 userx  ncar      8192 May 13 14:32 Tools
-rwxr-xr-x   1 userx  ncar      9330 May 12 11:33 check_input_data
-rwxr-xr-x   1 userx  ncar    10092 May 12 11:33 configure
-rwxr-xr-x   1 userx  ncar     3085 May 12 11:33 create_production_test
-rw-r--r--   1 userx  ncar     4454 May 13 17:12 env_build.xml
-rw-r--r--   1 userx  ncar     5635 May 13 14:32 env_case.xml
-rw-r--r--   1 userx  ncar     7029 May 13 14:32 env_conf.xml
-rw-r--r--   1 userx  ncar      614 May 13 17:12 env_derived
-rw-r--r--   1 userx  ncar     5916 May 13 17:12 env_mach_pes.xml
-rwxr-xr-x   1 userx  ncar     2199 May 13 14:32 env_mach_specific
-rw-r--r--   1 userx  ncar    10466 May 13 14:32 env_run.xml
-rwxrwxr-x   1 userx  ncar      574 May 13 17:12 mycase1.bluefire.build
-rwxrwxr-x   1 userx  ncar      836 May 13 17:12 mycase1.bluefire.clean_build
-rwxrwxr-x   1 userx  ncar      802 May 13 17:12 mycase1.bluefire.l_archive
-rwxrwxr-x   1 userx  ncar     3938 May 13 17:12 mycase1.bluefire.run
-rwxr-xr-x   1 userx  ncar    10388 May 12 11:33 xmlchange
```

The diagram shows three labels in boxes on the right side of the terminal output, with red arrows pointing to specific files:

- check_input_data** points to the file `check_input_data` in the terminal output.
- env_build.xml** points to the file `env_build.xml` in the terminal output.
- .build script** points to the file `mycase1.bluefire.build` in the terminal output.

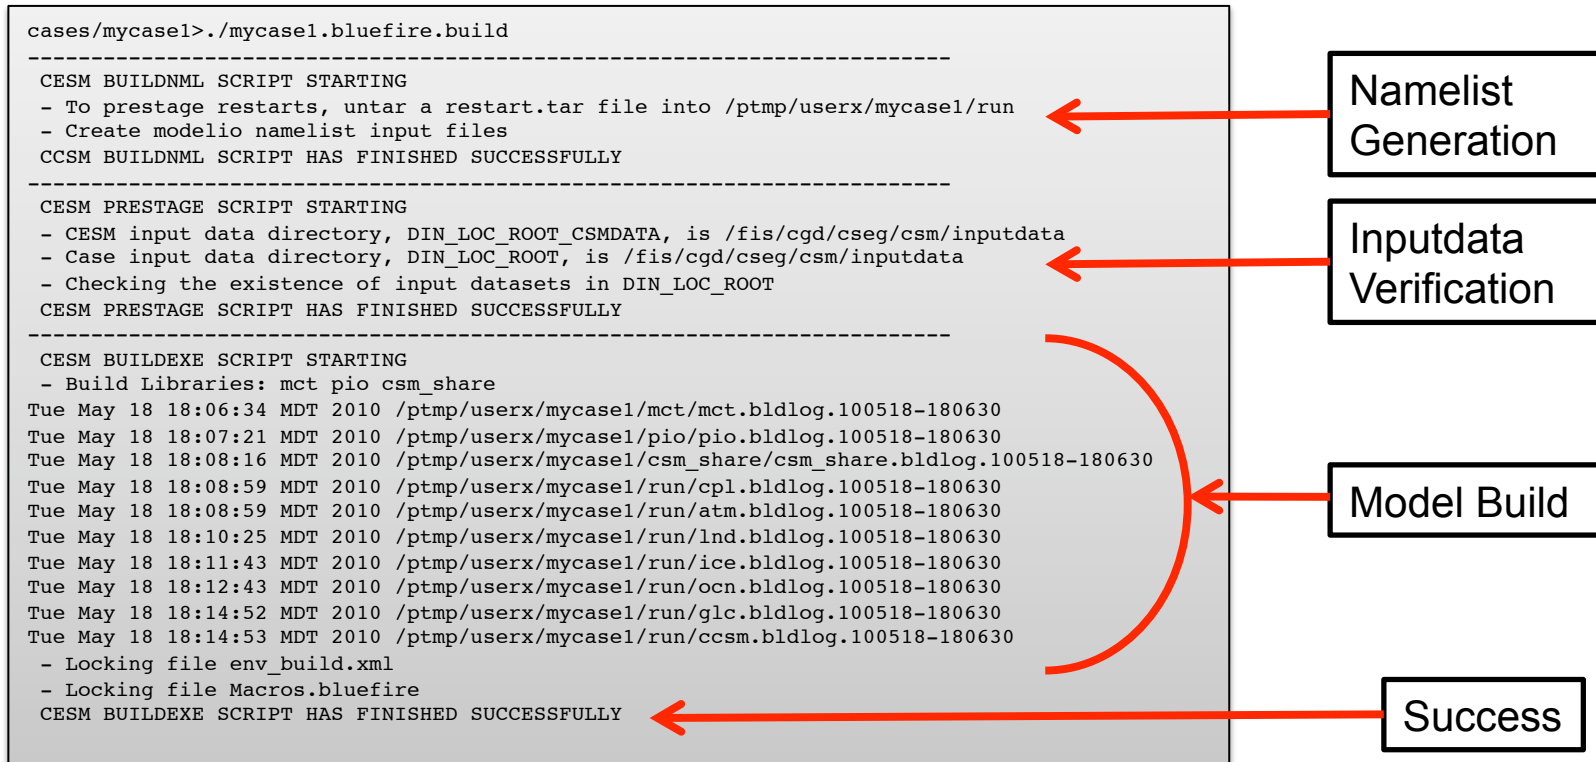

(3) Modifying Source Code

- Code modified in the models directory will apply to all new cases created – PROBABLY A BAD IDEA
- Modified code in the CASE SourceMods subdirectory applies to that case only
- Files in the the SourceMods must be in proper subdirectory, eg. pop2 code must be in src.pop2

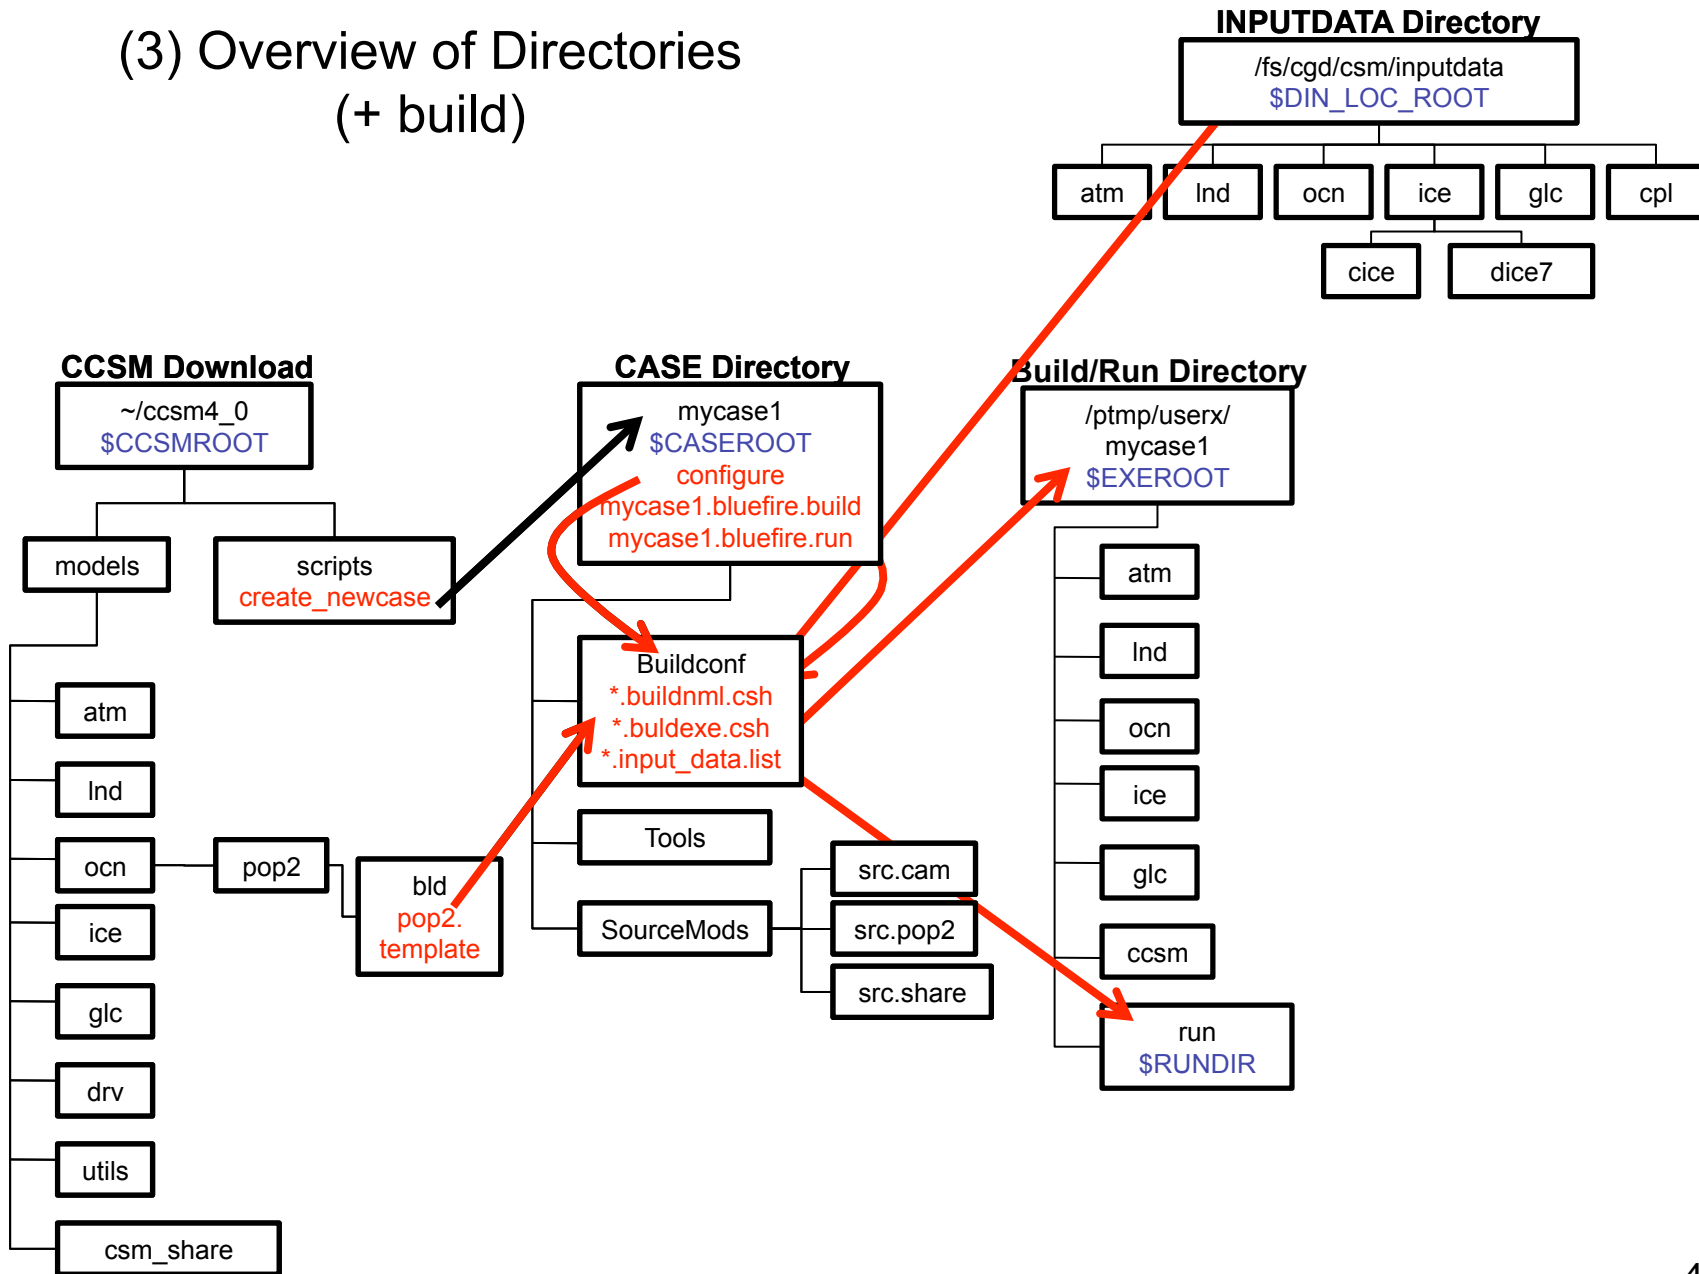

(3) Running the .build Script

- Generates input files (namelist) by running the buildnml.csh scripts for each component
- Checks for missing input data by running check_input_data
- If any inputdata is missing, the build will abort, but it will provide a list of missing files
- If any inputdata is missing, you must run the script check_input_data -export and then re-build
- check_input_data -export will use svn to put required data in the inputdata directory
- Builds the component model libraries and then final executable by running the buildexe.csh scripts for each component

(3) Overview of Directories (+ build)

(3) Your \$RUNDIR after running .build

```
cases/mycase1> source Tools/ccsm_getenv  
cases/mycase1> echo $RUNDIR  
/ptmp/userx/mycase1/run  
cases/mycase1> ls -al $RUNDIR
```

```

 - (4) Running the Model: Initial Run and Output Data**
 - (5) Running the Model: Continuation Runs

Work Flow: Super Quick Start

These unix commands built and ran the model on a supported machine named "bluefire"

```
# go to root directory of source code download
cd /path/to/source/code/download/cesml_0/

# go into scripts subdir
cd scripts

# (1) create a new case in your home dir
create_newcase -case ~/mycase.01 -res f19_g16 -compset B_1850 -mach bluefire

# go into the case you just created in the last step
cd ~/mycase.01/

# (2) configure the case
configure -case

# (3) build the executable
mycase.01.bluefire.build

# (4) submit an initial run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
source Tools/ccsm_getenv
ls -lFt $RUNDIR
ls -l logs

# when the initial run finishes, change to a continuation run
xmlchange -file env_run.xml -id CONTINUE_RUN -val TRUE

# (5) submit a continuation run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
ls -lFt $RUNDIR
ls -l logs
```

(4) Running the Model: an Initial Run

- Step (4) is to do an initial run of the model
- Initial runs are usually short (eg. 5-days) used to verify the model is running correctly
- May want to edit env_run.xml file before running (eg. to specify length of run)
- May want to modify namelist settings before running the model
 - Via env_run.xml variables
 - Directly in the Buildconf/*.buildnml.csh files
- The run script
 - Generates the namelist/input files (again)
 - Verifies existence of input datasets (again)
 - **DOES NOT** build (or re-build) the executable

```
cases/mycase1> bsub < mycase1.bluefire.run
```

```
cases/mycase1>bsub < mycase1.bluefire.run  
Job <40597> is submitted to queue <regular>.
```

```
cases/mycase1> bjobs
```

```
cases/mycase1>bjobs  
JOBID  USER  STAT  QUEUE   FROM_HOST  EXEC_HOST  JOB_NAME  SUBMIT_TIME  
40597  userx  PEND  regular  be1105en  be1105en  myCase1  May 18 18:30
```

(4) Output in Your CASE Directory

- A job completed successfully if “SUCCESSFUL TERMINATION OF CPL7-CCSM” appears near the end of the cpl.log file

```

(4) Output in Short Term Archiving Directory

- Output data is originally created in \$RUNDIR
- But when the run ends, output data is moved into a short term archiving directory
- Why?
 - Cleans up the \$RUNDIR
 - Migrates output data away from a possibly volatile \$RUNDIR
 - Gathers data for the long term archive script which can then save the data a permanent long-term storage area

```
cases/mycase1>echo $DOUT_S_ROOT

(4) Overview of Directories (+ run + short term archive)

Next Step In the Basic Work Flow

- One-Time Setup Steps
 - (A) Registration and Download
 - (B) Create an Input Data Root Directory
 - (C) Porting

- Creating & Running a Case
 - (1) Create a New Case
 - (2) Configure the Case
 - (3) Build the Executable
 - (4) Running the Model: Initial Run and Output Data
 - (5) Running the Model: Continuation Runs**

Work Flow: Super Quick Start

These unix commands built and ran the model on a supported machine named "bluefire"

```
# go to root directory of source code download
cd /path/to/source/code/download/cesml_0/

# go into scripts subdir
cd scripts

# (1) create a new case in your home dir
create_newcase -case ~/mycase.01 -res f19_g16 -compset B_1850 -mach bluefire

# go into the case you just created in the last step
cd ~/mycase.01/

# (2) configure the case
configure -case

# (3) build the executable
mycase.01.bluefire.build

# (4) submit an initial run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
source Tools/ccsm_getenv
ls -lFt $RUNDIR
ls -l logs

# when the initial run finishes, change to a continuation run
xmlchange -file env_run.xml -id CONTINUE_RUN -val TRUE

# (5) submit a continuation run to the batch queue
bsub < mycase.01.bluefire.run

# check status of job and output files
bjobs
ls -lFt $RUNDIR
ls -l logs
```

(5) Running the Model: Continuation Runs

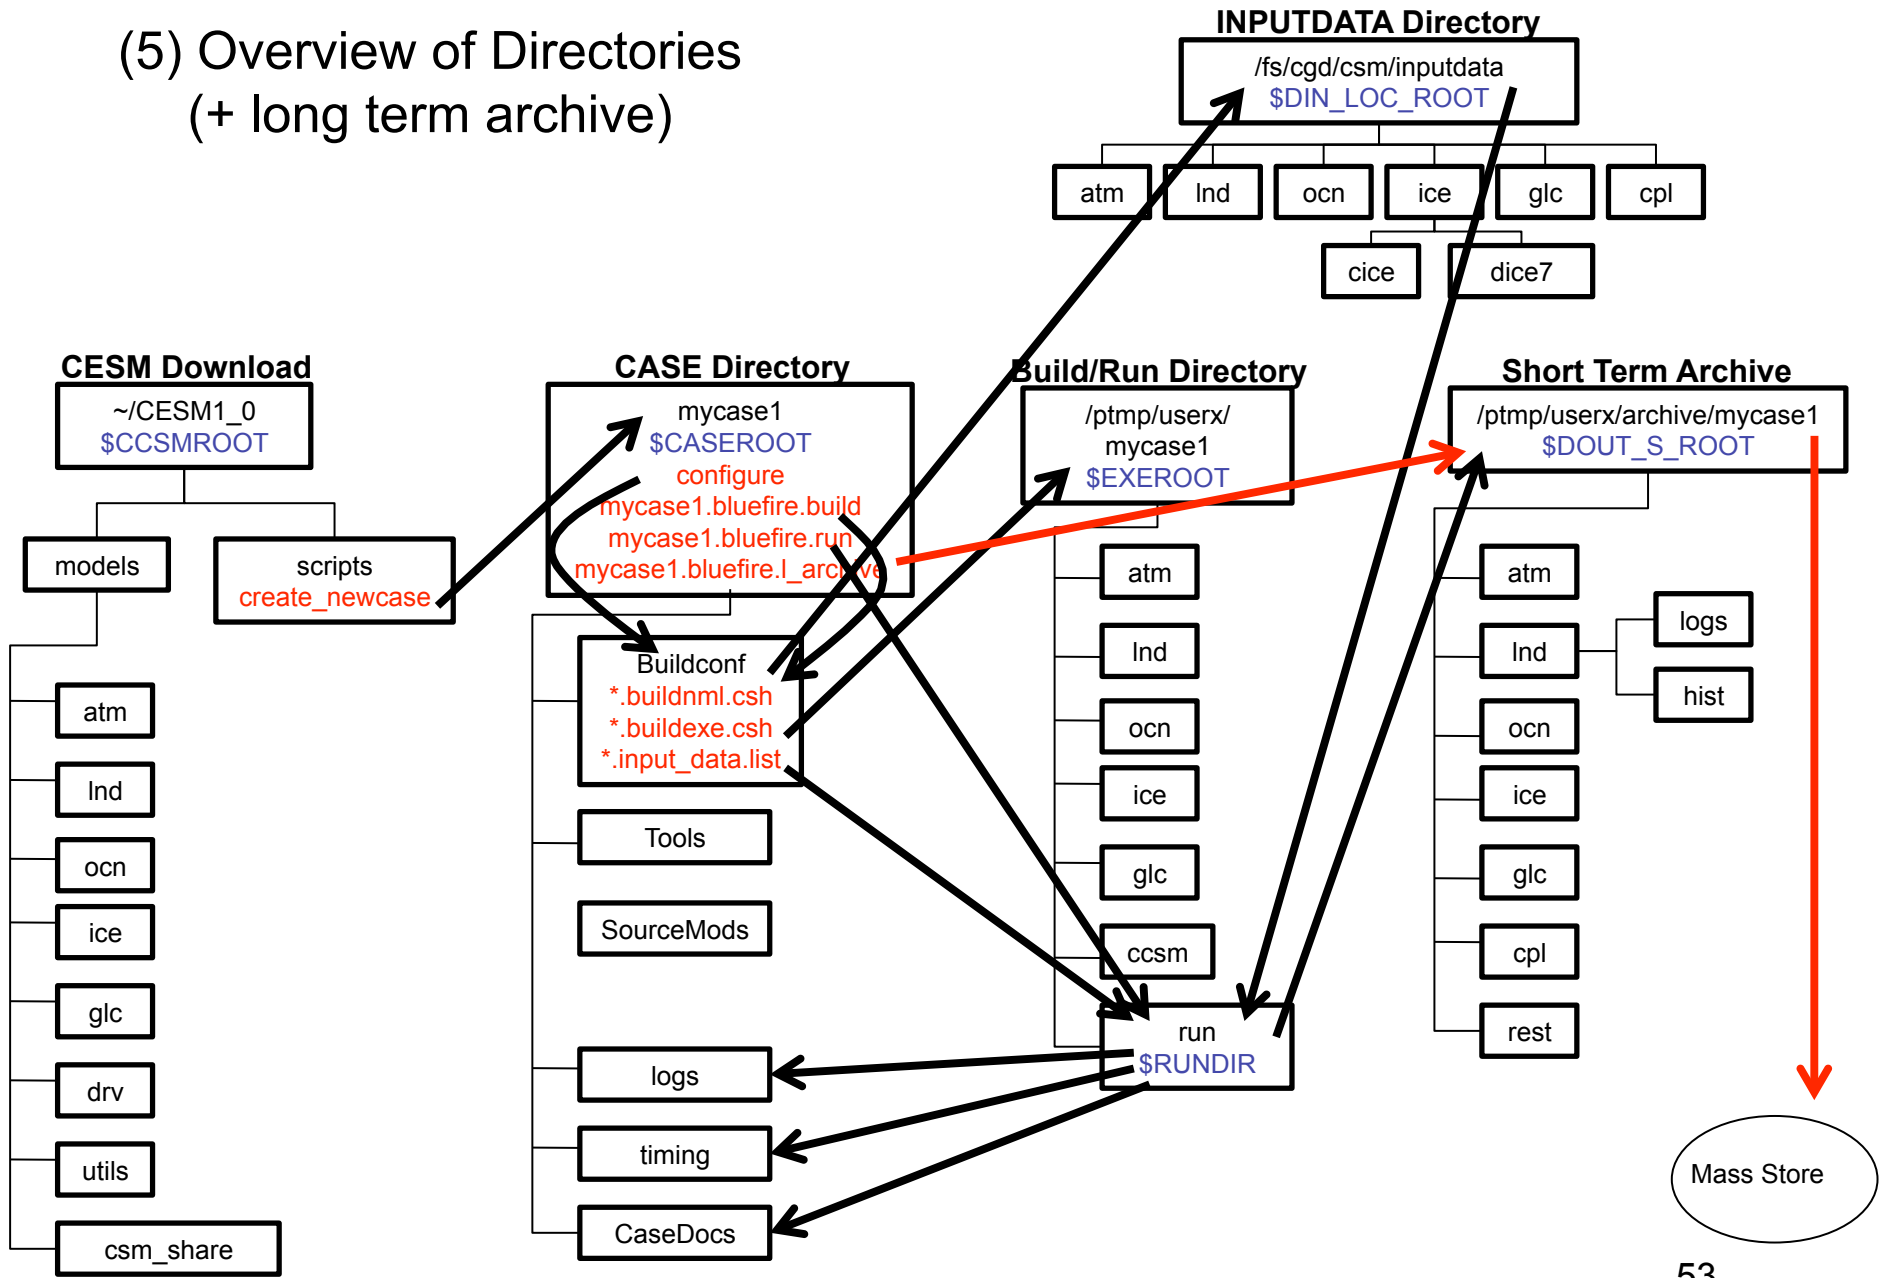

- You should start with a short initial run, described in step (4)
- Carefully examine the output to verify that the run is doing what you want it to
- You might rerun the initial run several times to fix problems
- If the initial run looks good...

- Step (5) is a continuation run
- Change CONTINUE_RUN to TRUE in env_run.xml
- Probably will change STOP_OPTION to run the model longer
- May want to turn on auto-resubmit option in env_run.xml (RESUBMIT)
- May want to turn on “long term archiving” in env_run.xml (DOUT_L_MS)

(5) Long Term Archiving

- Why?
 - Migrates output data away from a possibly volatile `$DOUT_S_ROOT` into a *permanent long-term storage area*
 - Long term archiving script moves data conveniently and in parallel
- To turn on short term archiving (default is on)
 - Set `DOUT_S` to `TRUE` in `env_run.xml`
- To turn on long term archiving (default is off)
 - Set `DOUT_L_MS` to `TRUE` in `env_run.xml`; this causes the run script to automatically submit a long term archiver job at the end of every successful run. The long term archiver moves data from the short term archive directory to a mass storage system, runs in batch on one processor, can run in parallel with a production job, and will not interfere with a production job or vice versa.

(5) Overview of Directories (+ long term archive)

The End

Appendix

- A) Overview of Directories
- B) Steps: Review and Undo
- C) Production Runs
- D) Debugging
- E) Porting
- F) Timing, Performance, Load Balancing
- G) Testing

Appendix A Overview of Directories

Appendix B: Steps, Review and Undo

| Step | “Undo” Command | Associated env Files |
|--------------------|---------------------------------------|----------------------------------|
| create_newcase | rm -rf \$CASE & rerun | env_case.xml |
| configure -case | configure -cleanall | env_conf.xml env_mach_pes.xml |
| \$CASE*.build | \$CASE*.clean_build | env_build.xml Macros.* |
| \$CASE*.run | rerun \$CASE*.run | env_run.xml |
| short term archive | set DOUT_S to FALSE in env_run.xml | |
| \$CASE*.l_archive | set DOUT_L to FALSE in env_run.xml | |

Appendix C: Production Runs

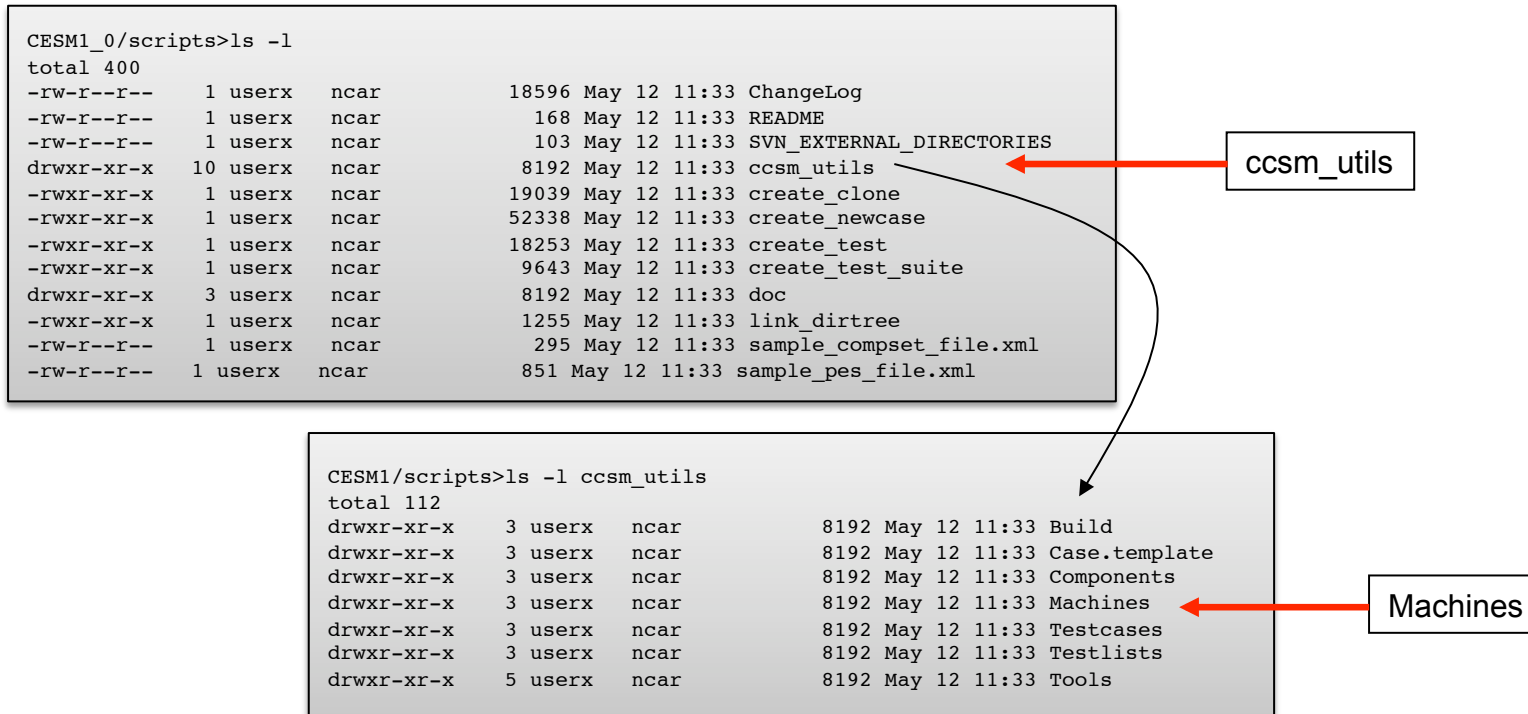

- Verify configuration and inputs
- Verify performance, throughput, cost, and load balance
- Verify exact restart for the production configuration. Use “create_production_test” in the case directory.
- Carry out an initial run of a particular duration and write out a restart set at the end of the run
 - Set STOP_OPTION to “nmonths”, set STOP_N
 - Set REST_OPTION==STOP_OPTION and REST_N==STOP_N to get a restart at the end of the run.
- When the initial run is complete
 - Set CONTINUE_RUN to TRUE in env_run.xml; this puts the model in restart mode and the model will start again from the last restart set
 - Set STOP_OPTION to “nmonths”, set STOP_N
 - Leave REST_OPTION==STOP_OPTION and REST_N==STOP_N to get a restart at the end of the run.
- To turn on short term archiving
 - Set DOUT_S to TRUE in env_run.xml
- To turn on long term archiving
 - Set DOUT_L_MS to TRUE in env_run.xml; this causes the run script to automatically submit a long term archiver job at the end of every successful run. The long term archiver moves data from the short term archive directory to a mass storage system, runs in batch on one processor, can run in parallel with a production job, and will not interfere with a production job or vice versa.
- To turn on the Auto Resubmit feature
 - Set RESUBMIT to an integer > 0 in env_run.xml; this causes the run script to resubmit itself after a successful run and decrement the RESUBMIT variable by 1. The model will automatically resubmit until the RESUBMIT variable is decremented to 0.

Appendix D: debugging

- The CESM scripts will trap invalid env variable values and types when possible and produce an error message
- The scripts can detect when the model needs to be re-configured or re-built due to changes in setup (env and Macros) files and an error message will be produced.
- If input data is not available locally, it will be downloaded automatically. If that data is not available on the CESM input data server, an error message will be produced.
- “configure –cleanall” backs up the build, run, and Buildconf files and resets them to original values. Manual changes to namelist values or batch submission settings will be lost in this step and have to be reimplemented manually. The old copies are placed under the MachinesHist directory in the case directory.
- If the build step fails, an error message will be produced and point users to a specific build log file.
- If a run does NOT complete properly, the stdout file often produces an error message like “Model did not complete – see ../cpl.log...”. That cpl log file is associated with the run but may not contain a relevant error message. All the log files will need to be reviewed.
- If a run does NOT complete properly, short term archiving is NOT executed and the timing files are NOT generated. In addition, log files are NOT copied into the case logs directory. Review the stdout/stderr files in the case directory and “cd” to the RUNDIR directory and systematically check the latest log files for error messages.
- If a run does NOT complete properly, check whether it timed out because it hit the batch time limit. If it hit the time limit, does it appear to have been running when it timed out or did it hang before it timed out? Check the timestamps on the log files in RUNDIR and check the timestamps of the daily timers in the cpl.log file.

Appendix E: Porting – Machines Directory

- Go to the scripts directory
- ccs_m_utils/Machines contains machine specific information, porting changes will occur there

Appendix E: Porting -- methods

- This is not as easy as we'd like it to be; see the CESM1 Users Guide for more details
- Generic Machine Method
 - Create a case using one of the generic machines and the following create_newcase options
 - -scratchroot (generic high level run directory, ie. /ptmp/userx)
 - -din_loc_root_csmdata (location of inputdata directory)
 - -max_tasks_per_node (max number of mpi tasks per node)
 - configure -case
 - Search for "GENERIC_USER", read those comments and edit as needed
 - Macros.* (for build settings)
 - env_mach_specific (for local machine settings)
 - *.run (for batch and launch settings)
 - Once things are working, back port the mods to some new machine specific scripts (see below)
- Specific Machine Method
 - cd scripts/ccsm_utils/Machines
 - copy a set of "close" machine specific files to your machine name
 - cp Macros.bluefire Macros.mine
 - cp env_machopts.bluefire env_machopts.mine
 - cp mkbatch.bluefire mkbatch.mine
 - Edit those files based on your machine configuration as best as you can
 - Add an entry in config_machines.xml for your machine (copy and paste) and edit those variables based on your machine
 - cd back to the script directory
 - create a case using your new machine entry (ie. mine) and test (see above)

Appendix E: Porting -- Tips

- Review your local-machine specific documentation and be prepared to reference it as you proceed.
- Prior to starting, know which compiler you want to use and review batch submission and job launching, especially for mpi jobs
- netcdf needs to be installed and you need to know how to link to it.
- With both generic or machine specific approaches, the goal is the same. You want to be able to setup and run CESM cases “out of the box” on your local machine and to be able to share that capability between multiple people. In other words, you want to port to a new machine once and be (mostly) done.
- With either the generic or machine specific approach, there will likely be several iterations between testing the case and updating the machine specific files before things work “out of the box”. Be patient.
- Start with an X compset and demonstrate an ability to create a case, build, and run “out of the box” before moving on to more complex configurations. X is an “all dead” configuration that is fast, requires minimal memory, requires minimal input datasets, runs in relatively arbitrary processor layouts, and will test the full coupler implementation with MPI.
- Generally, CESM builds all the components using a single CESM specified Makefile and Macros file. The exceptions are MCT and PIO which are built on the fly in CESM but leverage their own build systems. If you are having problems building MCT or PIO, look for the string “CONFIG_ARGS” in the Macros file. There are independent CONFIG_ARGS for MCT and PIO. Those config_arg options are passed to the MCT and PIO build systems. See other machines Macros files in scripts/ccsm_utils/Machines for examples of the CONFIG_ARGS settings on other machines and review the MCT or PIO build logs for errors. Errors generally occur more often in the configure/setup step of the MCT and PIO build than in the build itself.
- Reference the CESM users guide and see current implementations for other machines in the scripts/ccsm_utils/Machines directory.

Appendix F: Timing

- `env_mach_pes.xml` sets the component pe layout, to change it
 - modify `env_mach_pes.xml`
`mycase1> ./configure --cleanmach`
`mycase1> ./configure --case`
`mycase1> ./mycase1.bluefire.clean_build`
`mycase1> ./mycase1.bluefire.build`
`mycase1> bsub < mycase1.bluefire.run`
- Timing Files
 - See `mycase1/logs/cpl.log*` file to verify completion and get throughput, basic timing and memory output. `cpl.log*` also provides timing for each model day run so temporal variability in cost can be assessed.
 - See `mycase1/timing/ccsm_timing.mycase1.*` file for throughput and load balance (next slide)
 - See `mycase1/timing/ccsm_timing_summary.*` for individual rawer model timing output

```
mycase1>tail -20 logs/cpl.log.100519-210440
```

```

| GLC Run Time: | 0.000 seconds | 0.000 | seconds/mday | |
| CPL Run Time: | 13.536 seconds | 0.677 | seconds/mday | |

Appendix F: Load Balancing & env_mach_pes.xml

- Some env_mach_pes.xml variables are
 - NTASKS_* - number of mpi tasks assigned to the component
 - NTHRDS_* - number of openmp threads per mpi task for the component
 - ROOTPE_* - global mpi task rank of the component root mpi task

FOR EXAMPLE:

Appendix G: Testing

- create_production_test script in the case directory
- create_test in the scripts directory
 - Generates an automated CESM test
 - create_test -list produces a list of available tests
 - To use:

```
CESM1_0/scripts> ./create_test -testname ERS.f19_g16.X.bluefire -testid t1
CESM1_0/scripts> cd ERS.f19_g16.X.bluefire.t1
CESM1_0/scripts/ERS.f19_g16.X.bluefire.t1> ./ERS.f19_g16.X.bluefire.t1.build
CESM1_0/scripts/ERS.f19_g16.X.bluefire.t1> bsub < ERS.f19_g16.X.bluefire.t1.test
CESM1_0/scripts/ERS.f19_g16.X.bluefire.t1> cat TestStatus
```

```
CESM1_0/scripts/ERS.f19_g16.X.bluefire.t1>cat TestStatus
PASS ERS.f19_g16.X.bluefire
```

- create_test_suite in the scripts directory
 - to generate a suite of tests listed in a specific file

Note: DO NOT submit the run script, submit the test script
