

Simulating Ionospheric Plasma Physics Using Millions and Millions of Particles

By
Meers Oppenheim

Talk Outline

- What are simulations?
- What Ionospheric problems require simulations?
- Introduction to kinetic plasma physics
- Introduction to Particle-In-Cell (PIC) simulations
- Example problems
- Limitations of these methods

What are simulations?

- The Encyclopedia Britannica says “the use of a computer to represent the dynamic responses of one system by the behavior of another system modeled after it. A **simulation** uses a mathematical description, or model, of a real system in the form of a computer program.”
- Contrasts with “Model” – which we use to mean any precise description

What use are simulations?

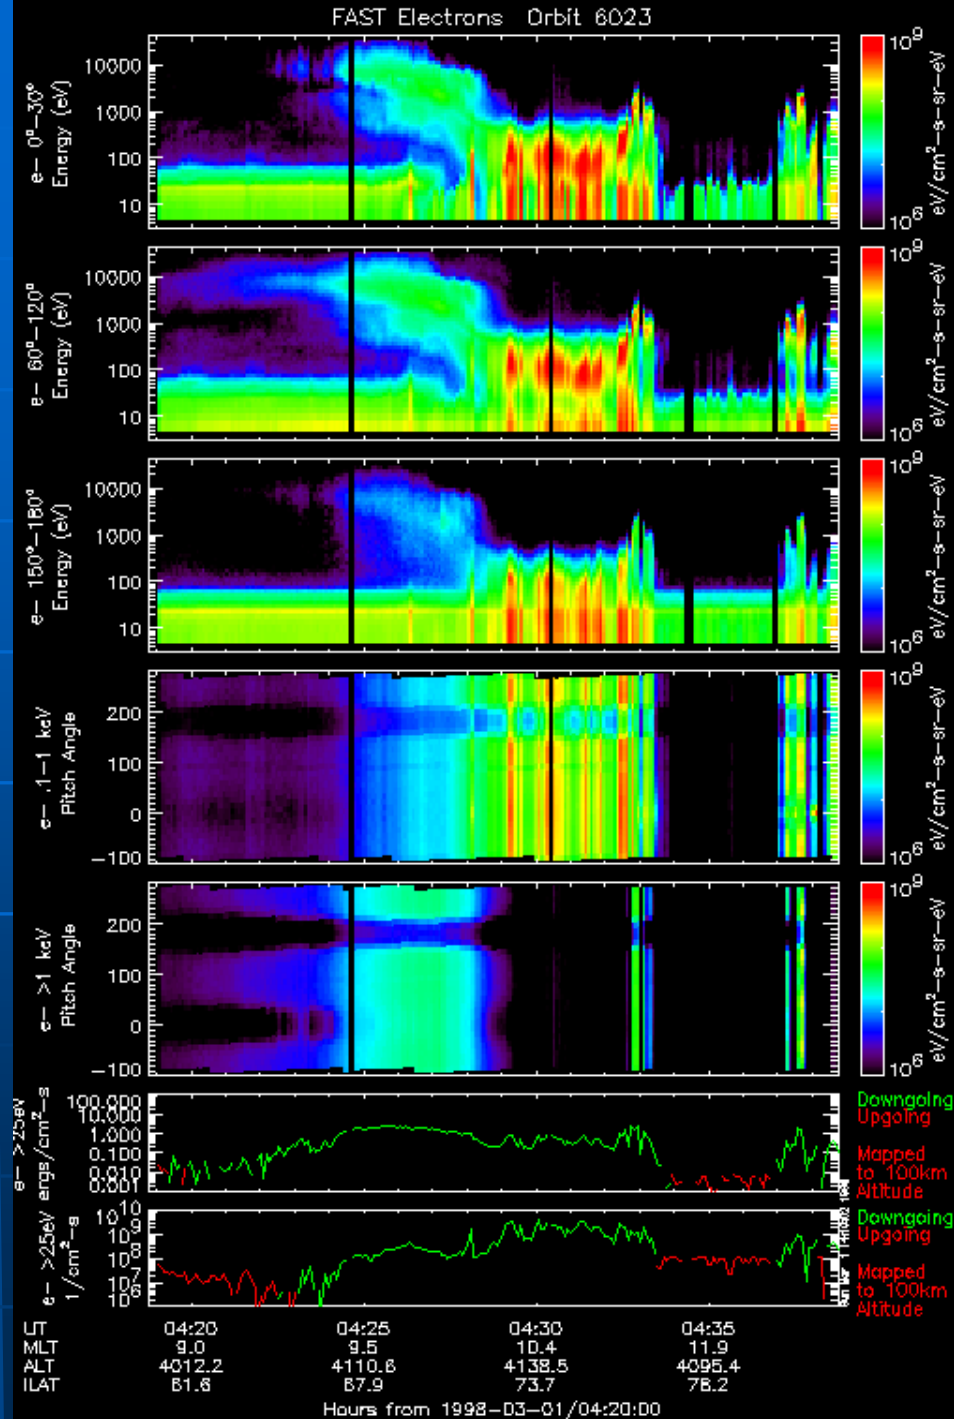

- Views of nature:
 - Physicists think that equations approximate the real world.
 - Engineers think that the real world approximates equations.
 - Mathematicians don't care...
- Simulations explore the behavior of systems too complex for analytical theory
 - Inhomogeneous systems
 - Nonlinear systems
 - Turbulence
- Simulations give insight into complex systems!

Where does one need simulations?

- The Auroral Ionosphere: Electrons accelerate from 3000-1500 km altitude by unknown mechanisms

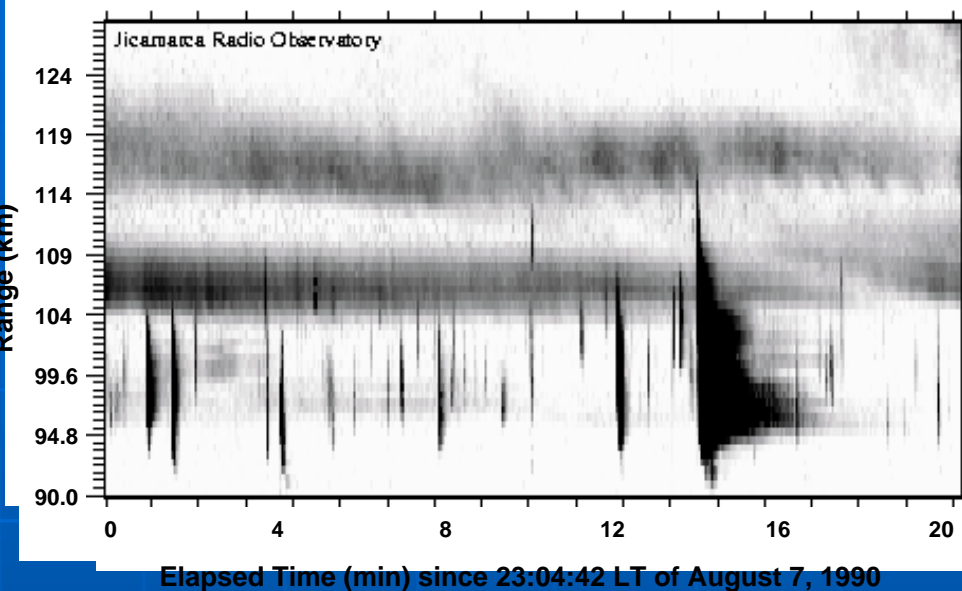

FAST Spacecraft measures turbulent auroral plasmas

Radars Measure Electron Density Irregularities in E & F Regions

Plasma Theory in 5 Minutes

1. Charged particles create fields:
Maxwell's Equations

$$\vec{\nabla} \cdot \vec{E} = \frac{e}{\epsilon_0} (n_i - n_e) \quad \vec{\nabla} \cdot \vec{B} = 0$$

2. Lorentz Force Accelerates Particles:

$$\vec{\nabla} \times \vec{E} = -\frac{\partial \vec{B}}{\partial t} \quad \vec{\nabla} \times \vec{B} = \mu_0 \frac{\partial \vec{E}}{\partial t} + \mu_0 \epsilon_0 \vec{J}$$

$$\frac{d\vec{v}_i}{dt} = \frac{q_i}{m_i} [E(\vec{x}, t) + \vec{v}_i \times B(\vec{x}, t)]$$

3. Collisions deflect particles (important in the lower ionosphere)

3. Too many particles – Need simplifications!

Particle Simulations

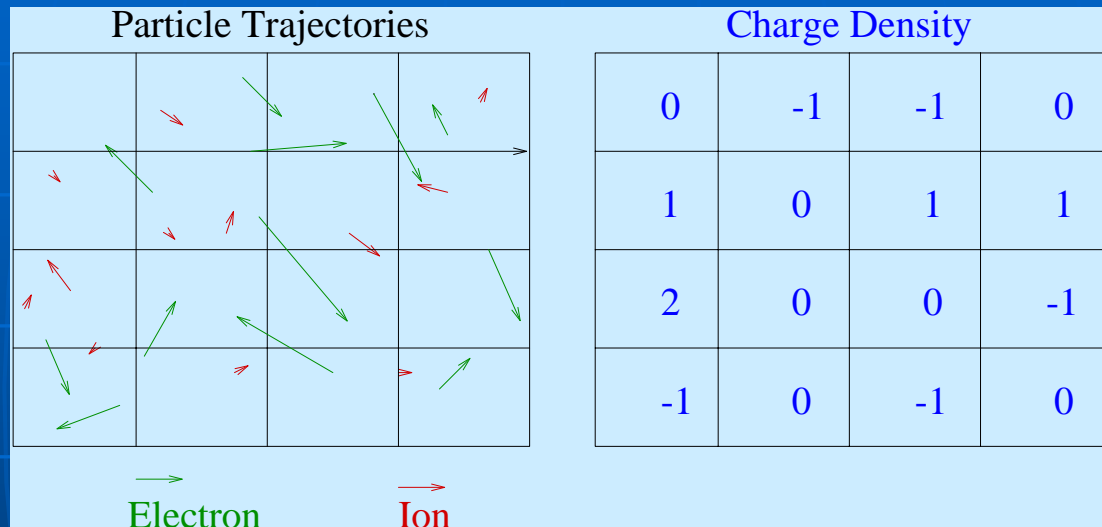

- Particles move within a box:
 - Position: \mathbf{x}_i
 - Velocity: \mathbf{v}_i
- Particles generate fields which accelerate other particles
- Too Slow! Speed proportional to the number of particles squared.

$$\vec{F}_{ij} = \frac{q_i q_j}{4\pi\epsilon_0 (\vec{x}_i - \vec{x}_j)^2}$$

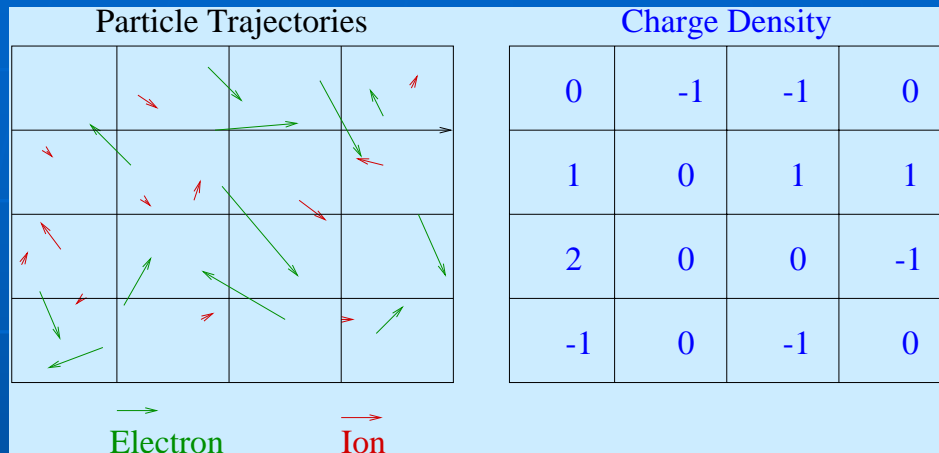

Particle-In-Cell (PIC) Steps:

1. Gather to determine charge density, ρ

2. Calculate Electric field: $\vec{\nabla} \cdot \vec{E} = \rho / \epsilon_0$
3. Update velocities:
$$\frac{d\vec{v}_i}{dt} = \frac{q_i}{m_i} [E(\vec{x}_i, t) + \vec{v}_i \times B(\vec{x}_i, t)]$$
4. Update Positions:
$$\frac{d\vec{x}_i}{dt} = \vec{v}_i$$
5. Go to Step 1

Assumptions made by PIC

- Short range interactions eliminated
 - Simulators with a meshes cannot model behavior smaller than the mesh
 - Features must be bigger than the mesh
- Each PIC particle models the behavior of more than 10^6 real particles
- Full kinetic physics represented
 - Particle trapping – resonant acceleration
 - Landau damping – resonant wave damping
- Fluid Simulators also use a mesh
 - Only one velocity in one location (unlike kinetic simulators)
 - Misses some physics but is less costly (per cell)

One Problem with PIC

- Particle noise from limited numbers of particles

- Random walk statistics: $\sigma \propto \sqrt{n_{particles/cell}}$

- Example $n=144$ particles/cell $\rightarrow \sigma_n=8.3\%$

- Fixes:

- Nature reduces this through electrostatic shielding
- Use non-point particles
- Use millions and millions of particles
- Use super computers!

Macro-particles fill a volume

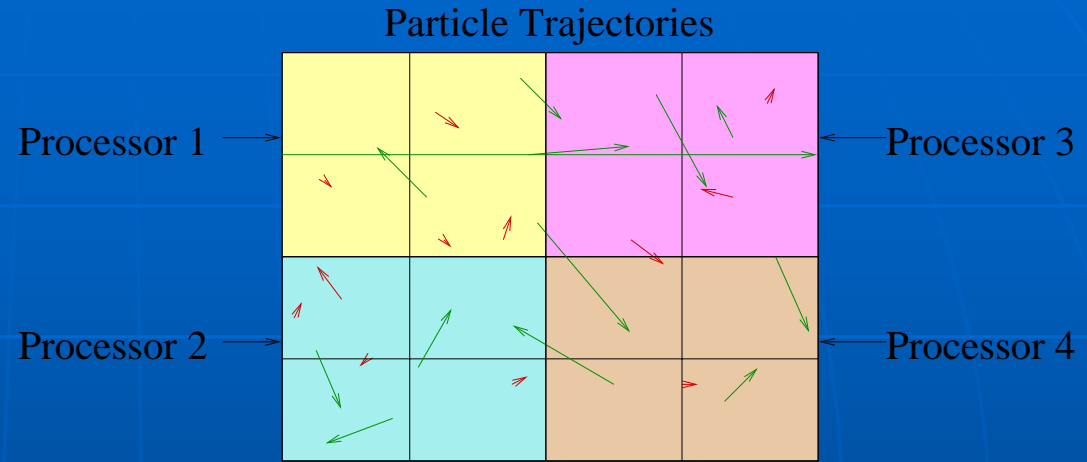

Boundary Conditions (BC)

- Simulations of all types require BC
- BC introduce limitations and, sometimes, error
- Example: *Periodic* is the simplest BC
 - The right side connects to the left
 - The top to the bottom
 - Particles leaving the Left reenter on the Right and visa versa
 - Particles leaving the top -> bottom ...

Solution: Parallel Supercomputing

- Domain Decomposition

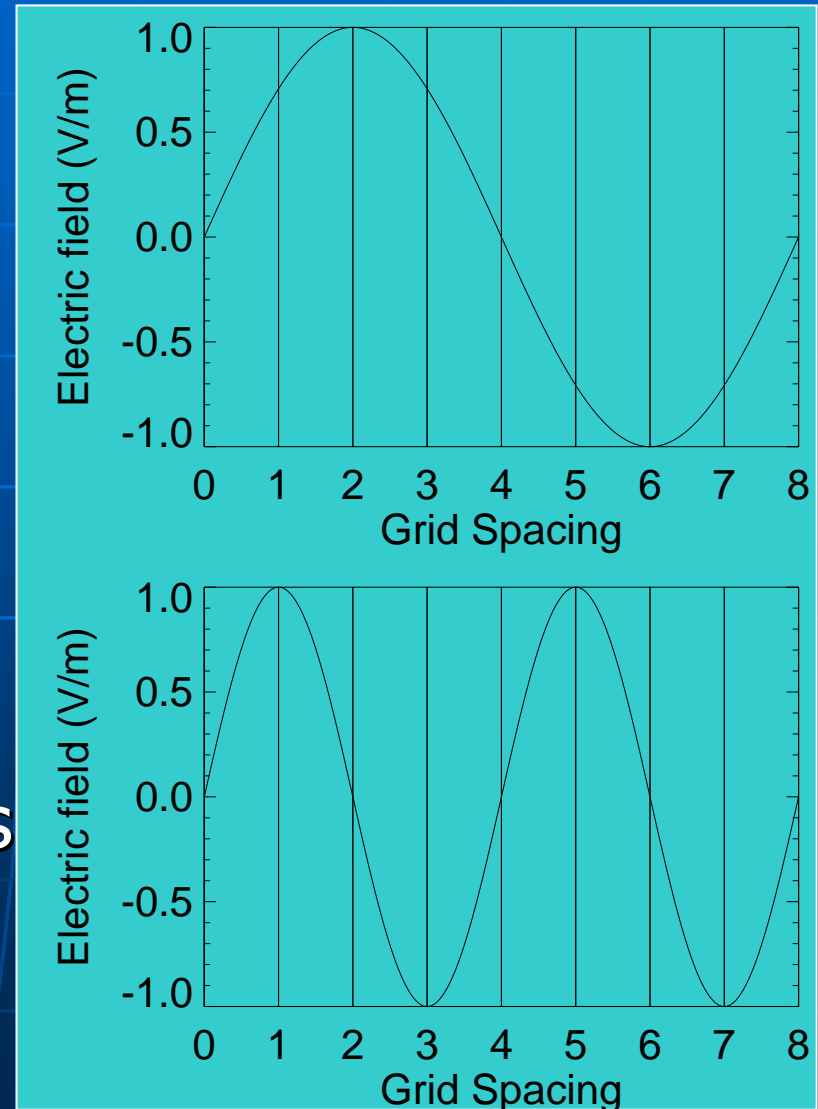

- Mesh Parallelization

Boundary Conditions Cause Limitations

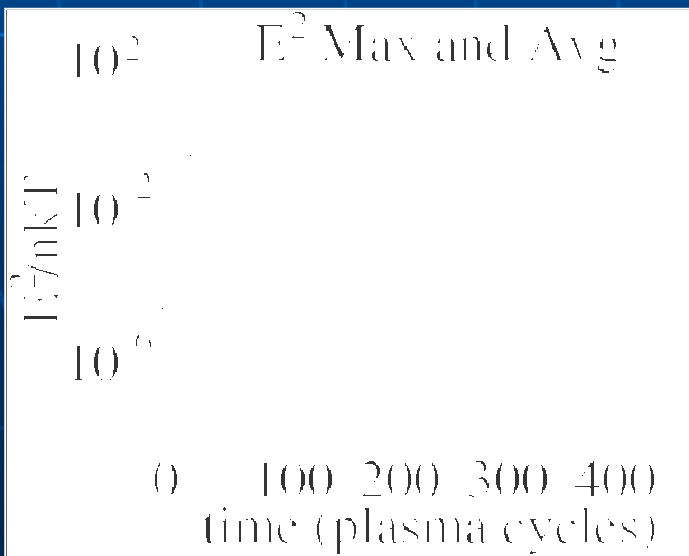

Example in 1D

- Periodic boundaries quantize the simulation:
 - Only a full wave or
 - Integer multiples allowed
 - Simulations must not focus on waves spanning the system
- Other BC have other issues
- True in fluid simulators as well

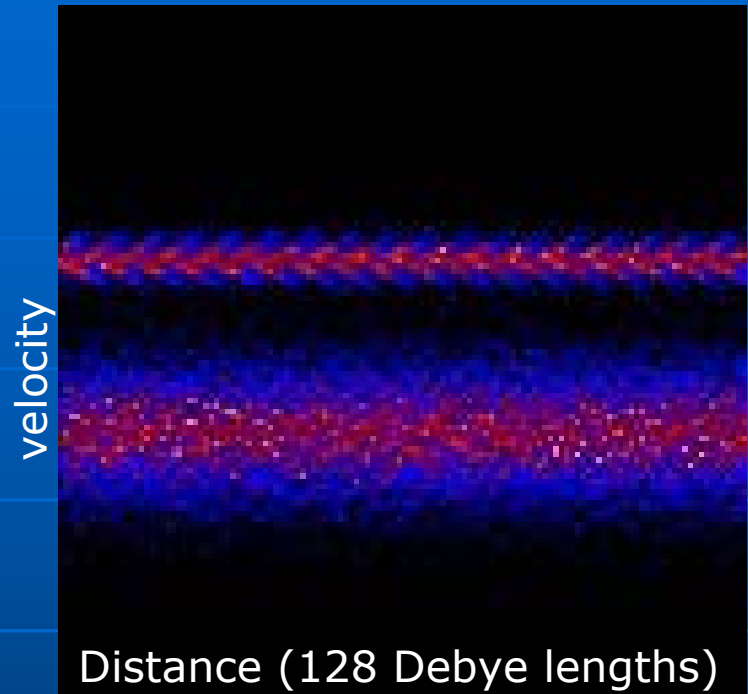

Example: 1D electron two-stream Instability

~1 Million particles

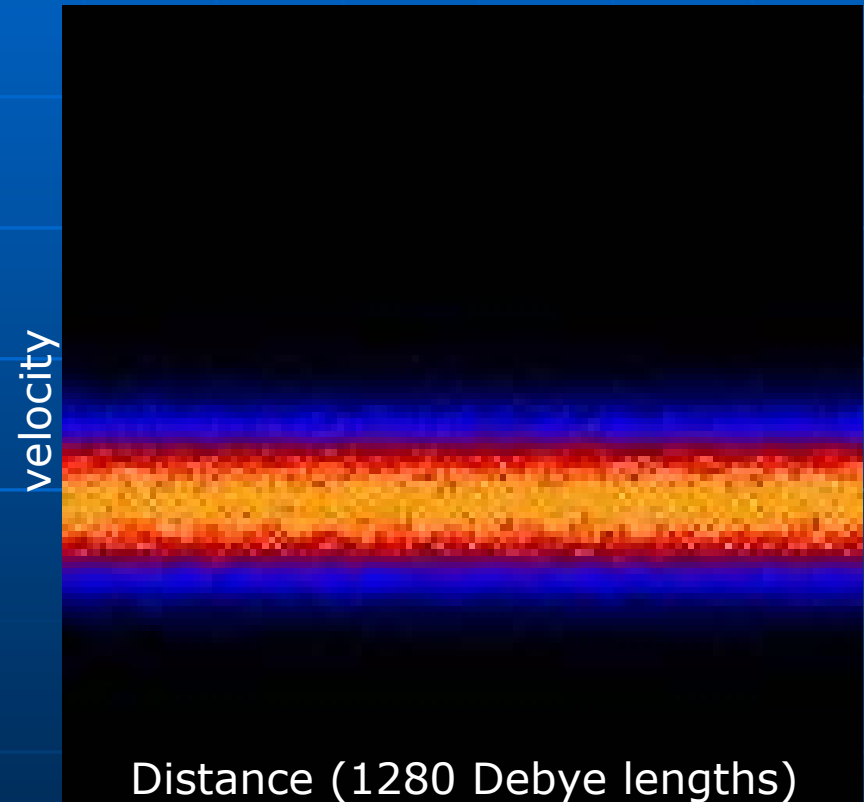

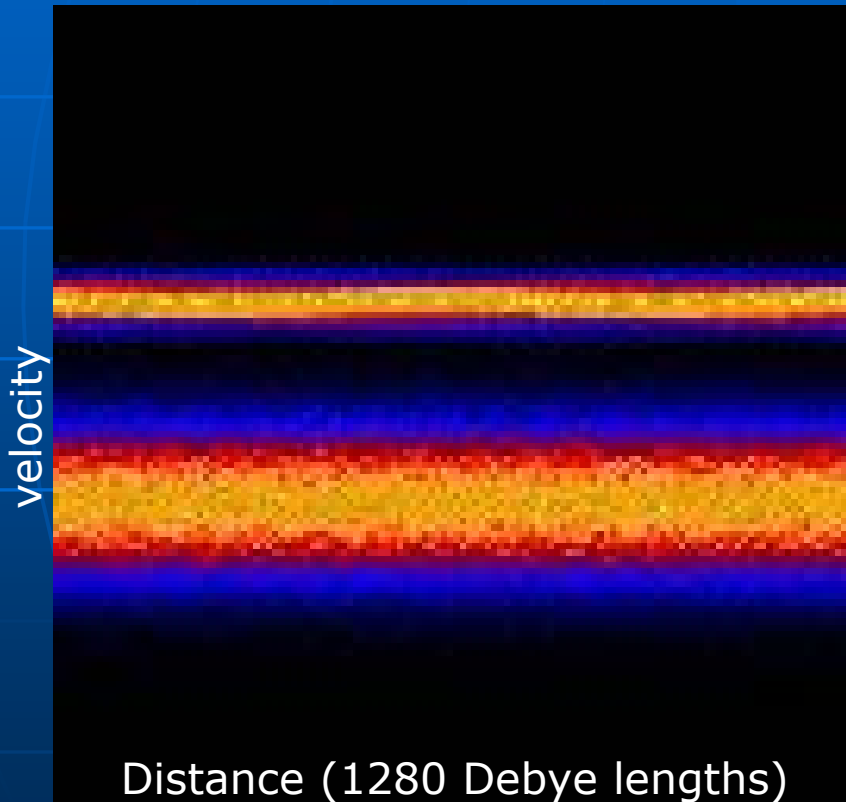

~1/64 Million particles

Expand grid spacing 10X

Eliminate Beam

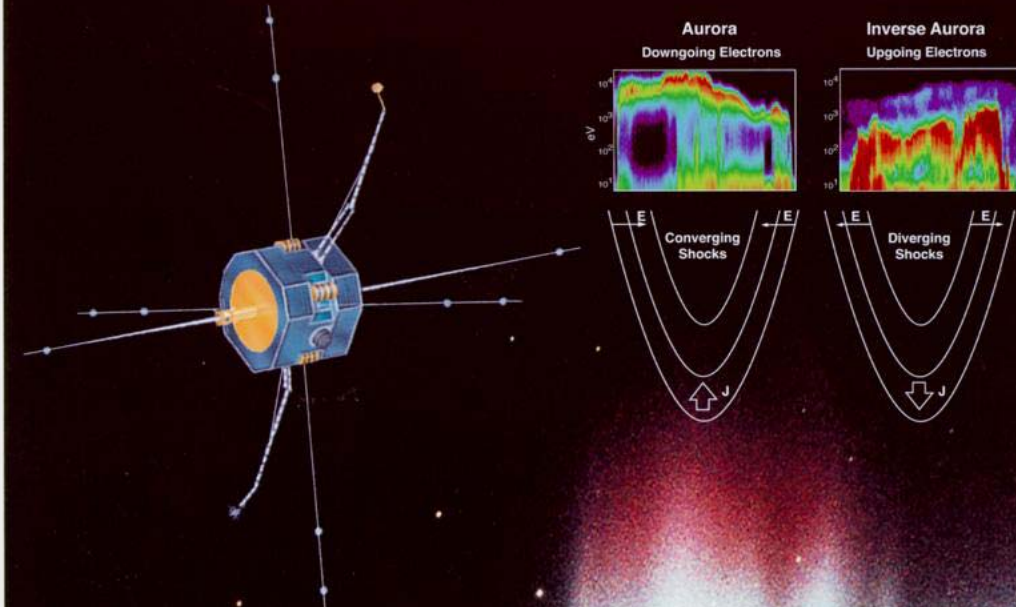

(8x longer simulation in time,
shown 16x as fast)

Simulation Limitations

- Systematic:
 - Do the equations represent the physics?
 - Do you resolve the important scales?
- Numerical:
 - Stability
 - Accuracy

Conclusions

- Simulations enable us to explore nonlinear systems
- Simulations subject to systematic limitations and numerical errors
- Enable us to better understand:
 - our models and
 - nature
