2016 Joint CEDAR-GEM Workshop

Session: Frontier research in equatorial aeronomy

June 19-24, 2016 - Santa Fe, New Mexico

Jicamarca Radio Observatory - Introduction

After more than 50 years, is scientific discovery still possible at Jicamarca?

- A research facility dedicated to monitor and study the Equatorial ionosphere and upper atmosphere.
- It is located at ~20 km east of Lima, Peru. (11.95°S , 76.87°W).
- Operates a variety of instruments: radars, ionosondes, magnetometers, GPS receivers, Fabry Perot interferometers, etc.

Its main instrument is one of the largest incoherent scatter radars in the World.

Outline

- Recent improvements & current capabilities
- Standard modes & new experiments
- Ideas for the future

Recent improvements and current capabilities

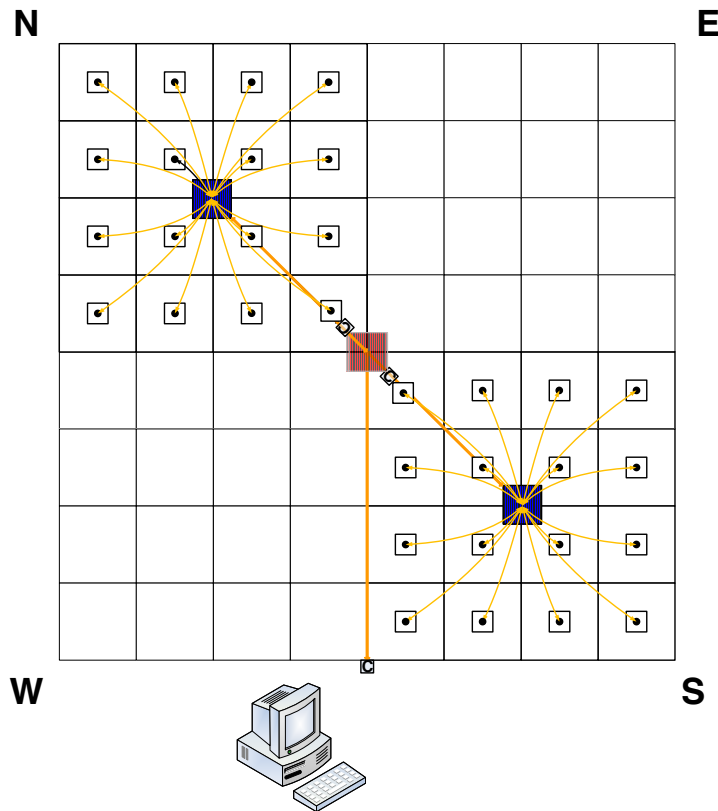

Characteristics of the Jicamarca Radar

- Operating frequency: 50 MHz
- Antenna: array of 18,432 half-wave dipoles covering an area of $300 \times 300 \text{ m}^2$.
- Grouped in 8×8 cross-polarized antenna modules (that can be combined in multiple ways).
- Pointing directions: within 3 degrees from on-axis.
- Transmitters: 4 x 1 MW peak-power with 5% duty cycle (2 under repair).
- Digital Receivers: 8 independent lines of reception (one per antenna quarter and polarization) + 8 lines for the imaging system.

Antenna Beam Switching & Solid state TRs

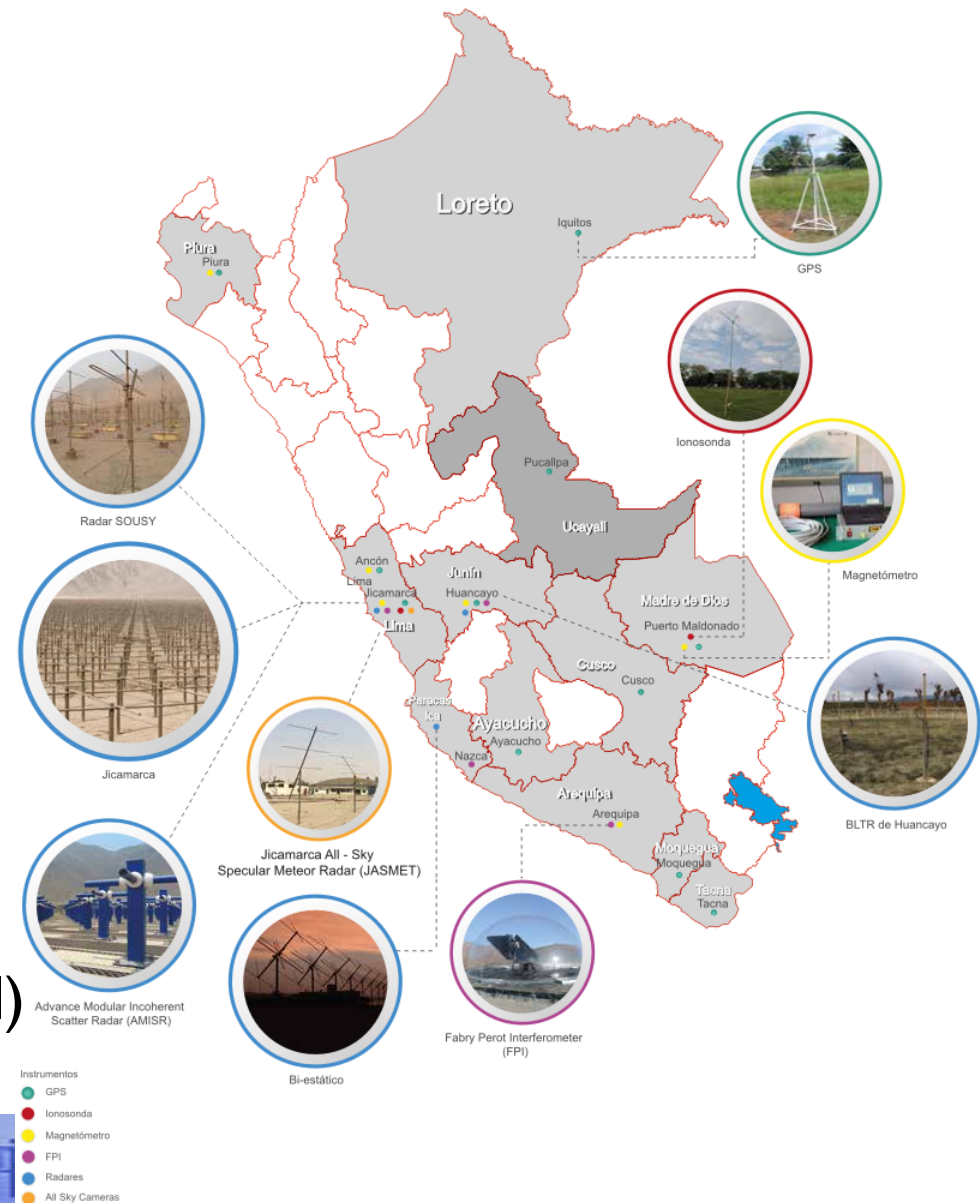

The electronic antenna beam switching system was finally implemented a year ago., though only for the North and South antenna quarters. This upgrade has increased significantly JRO capabilities.

The old TR switches (spark-gaps) were replaced by solid-state TRs (diodes). This upgrade reduces pulse-distortion and noise contamination issues we had with the old TRs.

Cluster of Instruments for Equatorial and Low-latitude Observations (CIELO)

- LISN (C.Valladares, UTDallas)
- Magnetometer chain (O.Veliz, IGP)
- Digisonde (B. Reinish, U. Mass. Lowell)
- VIPIR (E. Kudeki, J. Makela, Illinois)
- Beacon RXs (P. Bernhardt, NRL, Tsunoda, SRI)
- GNSS RXs (J. Morton, MU)
- CIRI Huancayo (J. Urbina, PSU)
- AMISR I4 (J.Arratia, UMET)
- FPI chain (A. Gerrard, NJIT)
- Airglow camera (C. Martinis, BU, G. Swenson,, Illinois)
- Multi-static HF radar (D. Hysell, Cornell)
- TIDDBIT (G. Crowley, ASTRA)

Standard modes and new experiments (pushing the radar capabilities)

Combo mode for simultaneous measurement of Ne, Te, Ti, Vd, and Zd

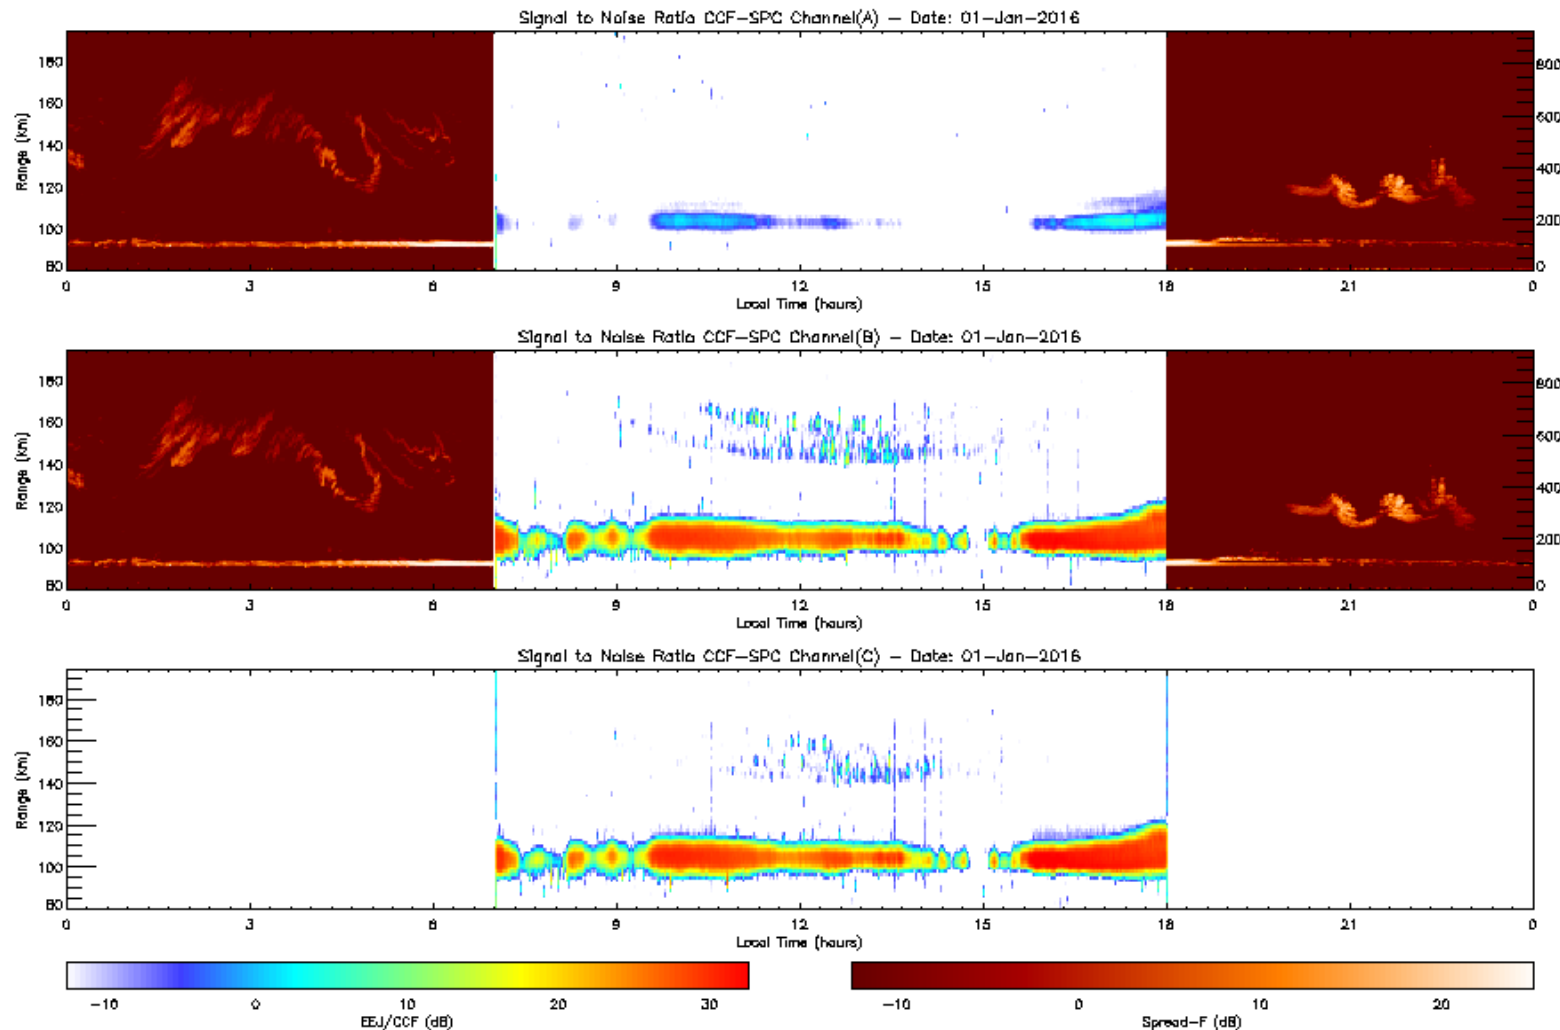

Simultaneous measurements of F-region densities, temperatures and drifts is now possible at Jicamarca applying a multi-beam radar technique that interleaves perpendicular-to-B and off-perpendicular observations.

This mode is used in most of the ISR coordinated campaigns since 2013.

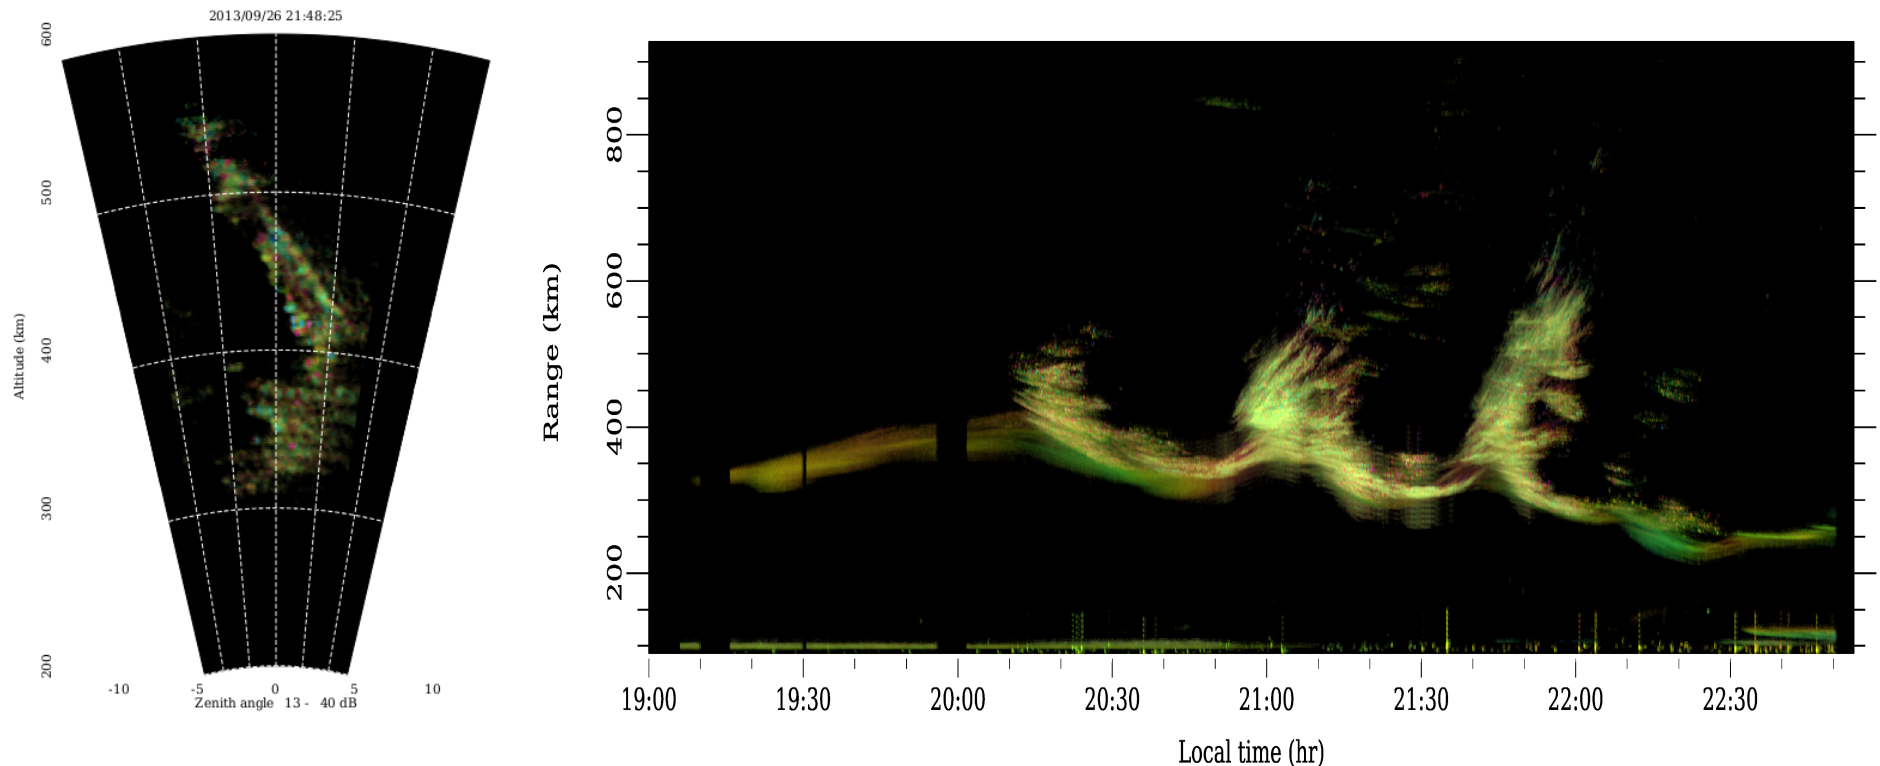

JULIA : EEJ + 150km + Spread-F observations

More than 4000 hours per year of plasma irregularities observations: EEJ, 150km echoes and Spread-F. Data available in Madrigal.

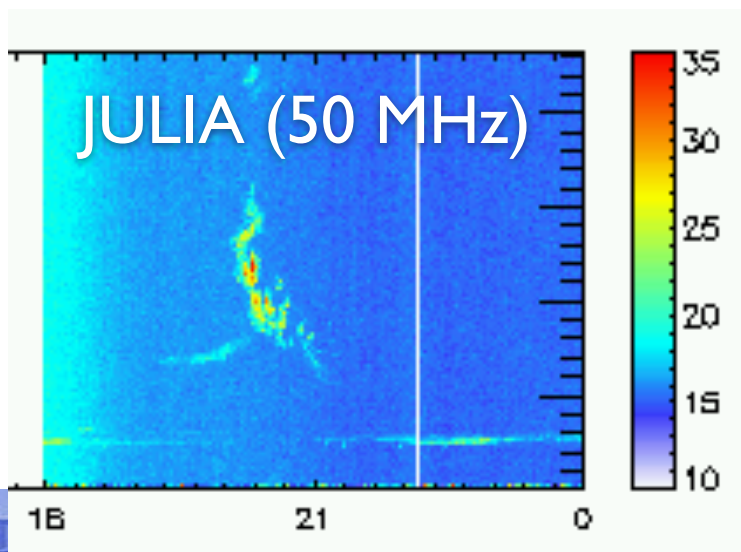

Radar imaging of ionospheric irregularities

Thu Sep 26 19:06:07 2013

Applying a radar imaging technique we can conduct 2-D observations of ionospheric irregularities, e.g., Spread-F. This type of observations are used to conduct forecasting and simulation studies of the occurrence of such irregularities in the equatorial ionosphere (e.g., Hysell et al [2014]).

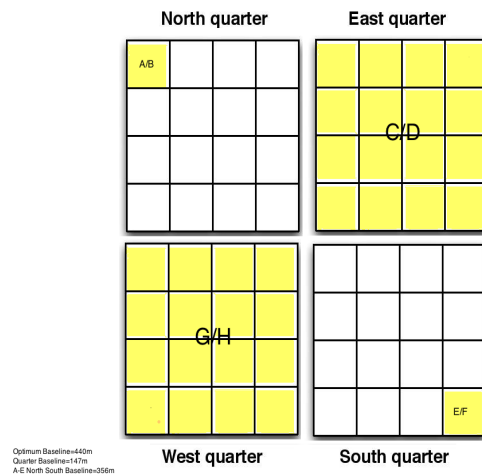

AMISR-I4 in parallel with JULIA

Since October 2015, AMISR-I4 and JULIA operates in parallel for simultaneous EEJ and Spread-F observations.

Lunar imaging - Preliminary results

A particular radar configuration was used to image the moon in October 2015. Using the Jicamarca radar as a SAR system, maps of the lunar surface were computed to study its features and characteristics.

This is a preliminary reconstructed map. Artifacts due to coding issues still need to be removed.

Very long pulse experiment

Pushing the radar to the maximum of its capabilities, we have transmitted a 4-msec pulse (600 km) to measure electron densities up to altitudes above 5000 km.

Stimulated Brillouin Scattering and Proton Gyroresonance experiments are being tested.

**Ideas for the future:
More new experiments and upgrades**

Ideas for new experiments at Jicamarca

Solar Radar

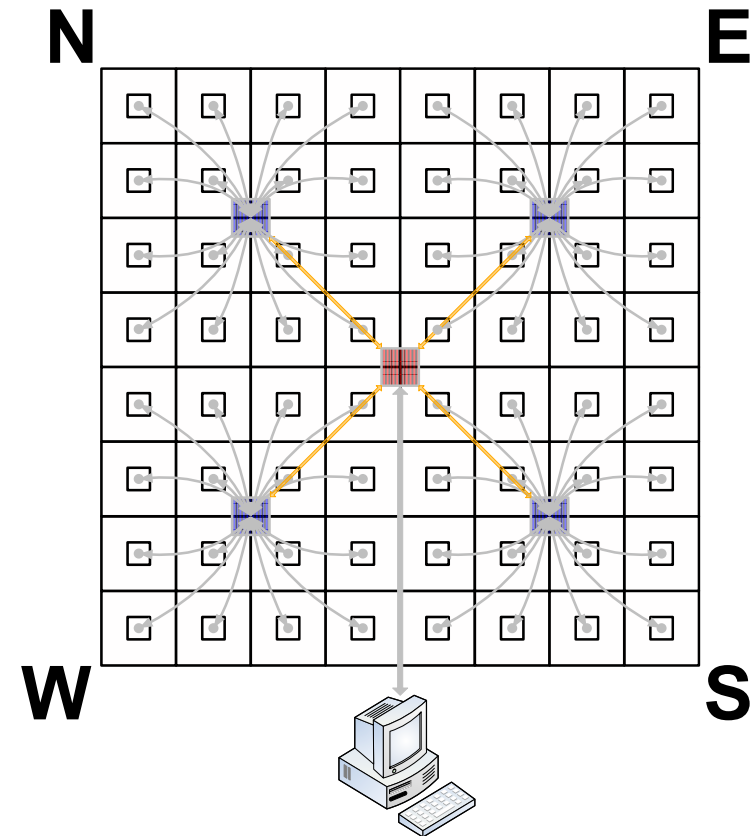

Ionospheric Heater

Short-term upgrades

- Complete the electronic beam steering system.
- Replace the antenna ground plane.

- Put fully operational the four high-power transmitters.
- Minimize cross-talk and local interference in the reception lines.

What is needed in
the long-term?

A completely rebuilt antenna array

Some considerations for the new array

- To keep pointing perp-to-B, we need to increase angular coverage from ± 3 deg to ± 10 deg.
- To improve the quality of estimated physical parameters or to increase altitude coverage, we need to deliver more power and use narrower beams.
- To track the Sun or any other object, we need to change the beam position from pulse to pulse.
- To improve our observational capabilities, we need to transmit different waveforms and antenna patterns.

Antenna upgrades I

To increase angular coverage and be able to keep pointing perp-to-B,

- We need to increase the number of antenna modules from 64 to at least 256.
- We also need to reduce the size of an antenna module from 12x12 elements to 8x8 or even better to 6x6 elements.

Antenna upgrades 2

To improve the quality of our drift estimates, or to increase altitude coverage.

- A larger antenna array (from 300x300m² to 400x400m²)

To track the sun or any other object.

- A new ABS system that changes beam position from pulse to pulse.

To transmit different waveforms and antenna patterns.

- A distributed power transmission system (i.e., one solid state 20 KW TX per module per polarization).
- Digital receivers in each antenna module.

Conclusion:

The Jicamarca incoherent scatter radar is a robust and flexible system that is often pushed to the maximum of its capabilities. However, in order to offer further possibilities, an important antenna upgrade should be conducted.

A wide-angle photograph of a solar farm in a desert. The foreground and middle ground are filled with rows of solar panel racks, each consisting of a metal frame with a single panel. The racks are arranged in a grid pattern that recedes into the distance. The ground is dry and sandy. In the background, there are several mountain ranges under a clear, light blue sky. The sun is visible as a bright spot on the horizon, creating a lens flare effect across the middle of the image.

Thanks for your attention!
