

CEDAR 2018

CU Boulder Presents...

Antarctic Meteor Radar

The First 90 Days

PI: Dr. Scott Palo

John Marino Presenting

Installed 2017 – 2018 Season | Operated by

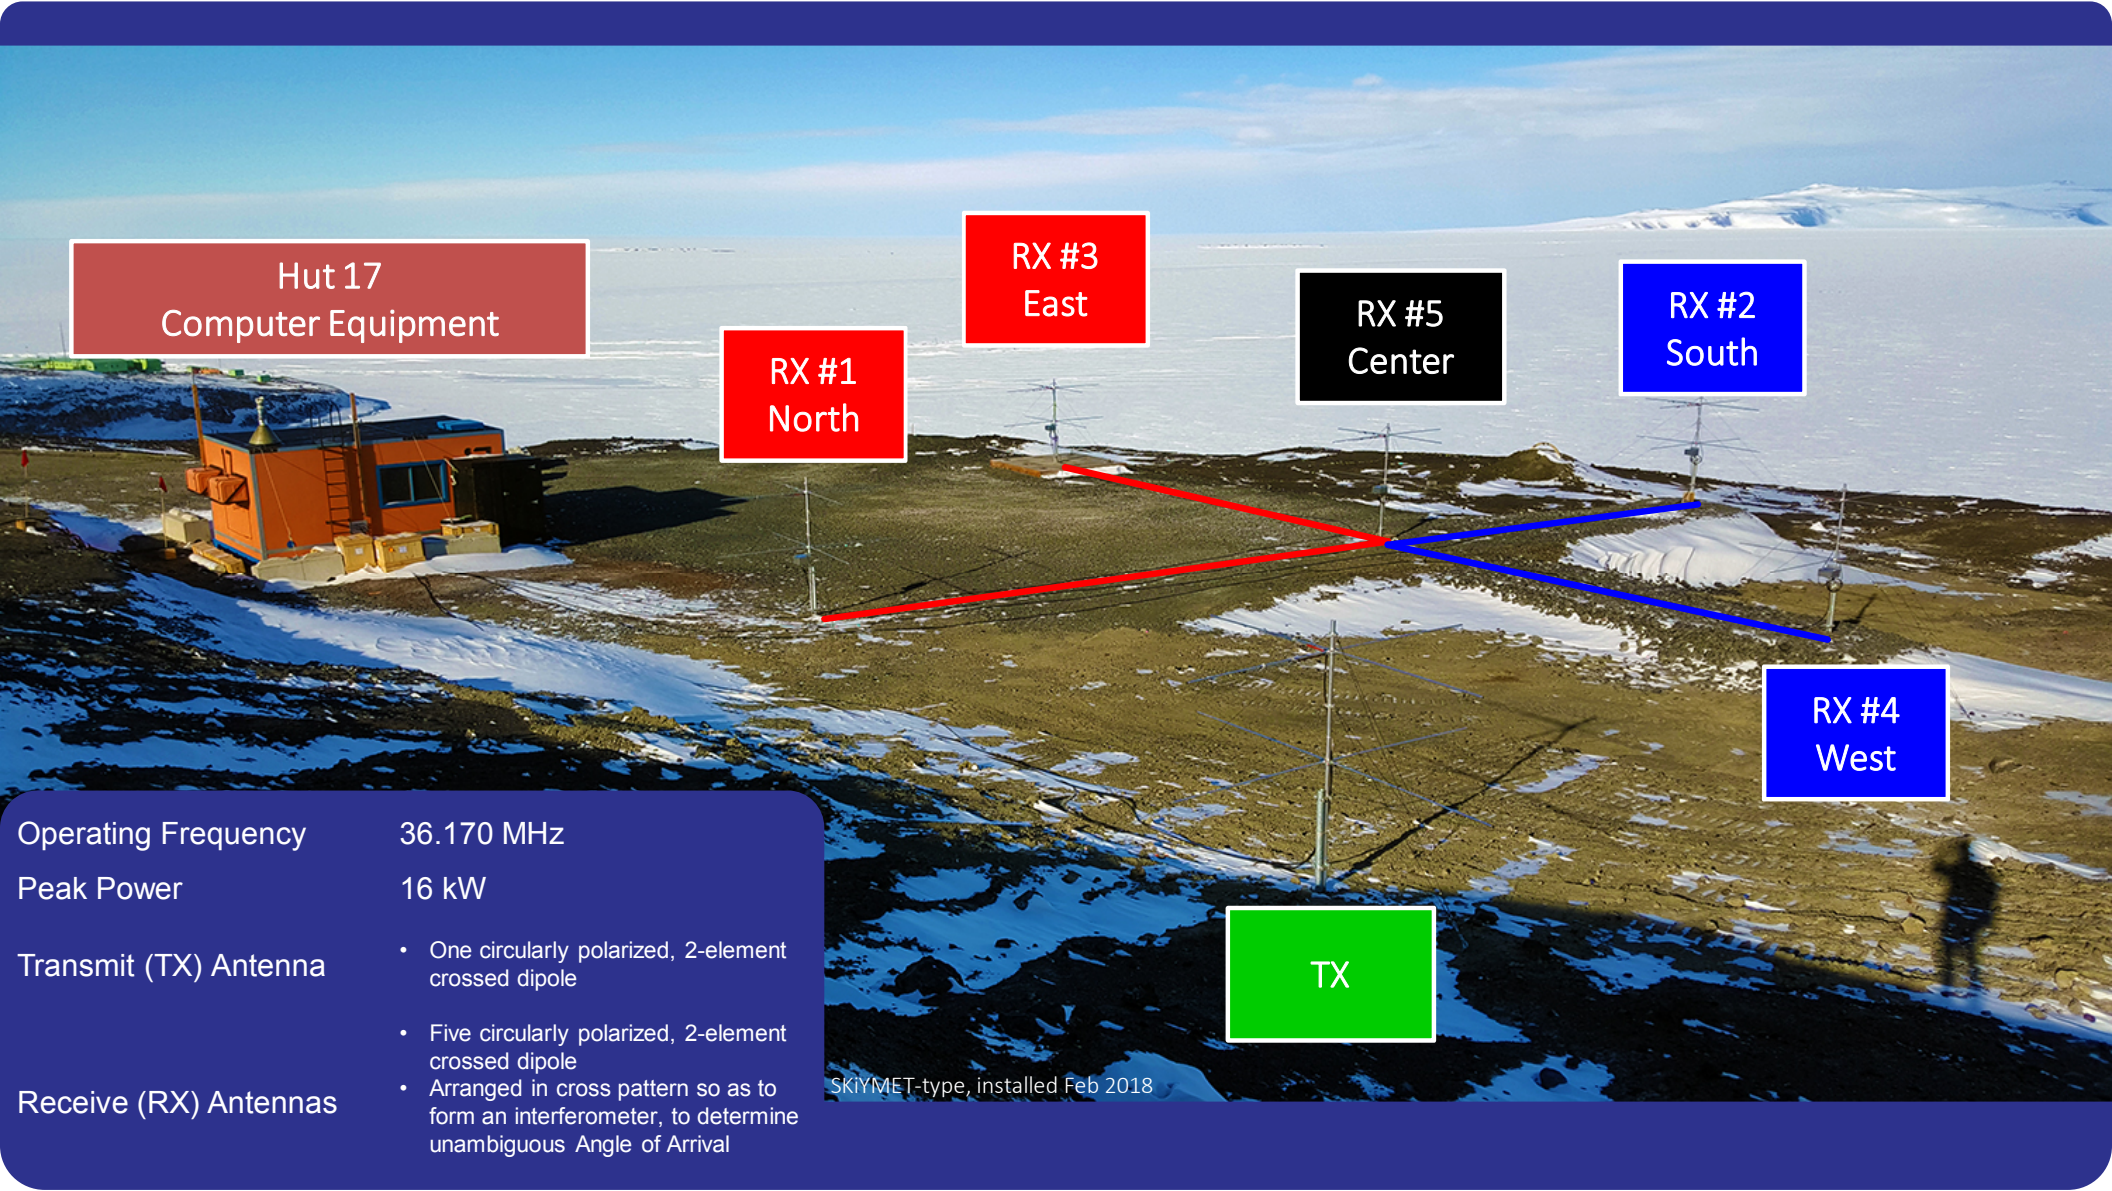

University of Colorado Boulder

Located at 77.8 S, 166.7 E

Between McMurdo (US)
and Scott Base (NZ)

Hut 17
Computer Equipment

RX #3
East

RX #5
Center

RX #2
South

RX #1
North

RX #4
West

TX

Operating Frequency	36.170 MHz
Peak Power	16 kW
Transmit (TX) Antenna	<ul style="list-style-type: none"> • One circularly polarized, 2-element crossed dipole
Receive (RX) Antennas	<ul style="list-style-type: none"> • Five circularly polarized, 2-element crossed dipole • Arranged in cross pattern so as to form an interferometer, to determine unambiguous Angle of Arrival

SKIYMET-type, installed Feb 2018

Spatial Plot

- Spatial Plot of Meteor Echoes
- Jun 20 – 26 2018
- (0,0,0) is receiver array location
- North refers to 'grid north' as defined for the Antarctic in the Universal Polar Stereographic (UPS) coordinate system.

Temporal History

- **Top** plot shows total hourly meteor counts
 - Range of 100 – 600 per hour
 - Average of about 250/hr
 - Diurnal variation clearly seen
- **Middle** plot shows mean meteor height per hr
 - Average of about 90 km depending on the time of day
- **Bottom** plot plots hourly histograms of meteor height in which *each pixel represents the total count per 1 hour per 1 km time bin.*

Campaign Snapshot

March 15th 2018 – Present (Jun 27th 2018)

Days In Operation	Total Number of Meteor Echoes	Count / Hour			Average Count / Day
104	621,375	MIN	AVG	MAX	5,974
		105	248	604	

Currently, our primary data product is wind ->

Hourly Wind Speed Components

Hourly Zonal and Meridional wind speeds from 82 – 109 km in ~ 3km bins

Some Next Steps

- Identify **atmospheric phenomena**
E. g. : Planetary waves, gravity waves, tides, etc.
- Attempt **finer resolution** in wind calculations
- Continue taking data to find **seasonal variability**
- Explore **additional data products**
E. g. : Temperature, new meteor showers / radiants, and others
- **Assimilate / validate / compare** with other instruments and numerical models
E. g. : LIDAR at McMurdo, Global-Scale Wave Model (GSWM), and others
