FITACF file → Range-Time Parameter plots (RTP)

1

Commonly used to investigate: TID • Ionospheric patches • ULF waves

¹Frissell et al. 2015

SuperDARN

Software practices

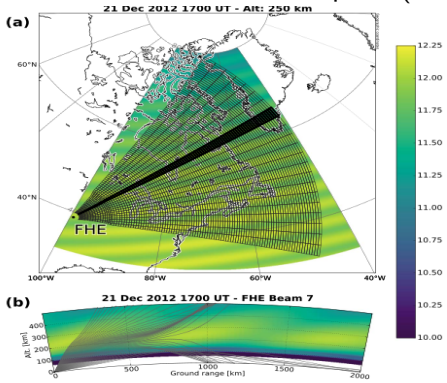

pyDARN

Reading SuperDARN data

Plotting SuperDARN data

Timeline

- Consistency
 - Style Guides - ex) PEP8 for python
 - Policies - How to structure the code?
 - Rules of the Road - What is the code development work flow?
 - Function/variable naming
- Code review - proof reading code to ensure practices and standards are being met
- Code readability - variable and function names that make sense to the audience

■ Testing

- Unit tests - testing a single unit of a function
- Integration testing - testing multiple functions together
- Bench marking - Performance analysis (speed, memory usage)
- Coverage testing - testing all lines of code

 - Decisions made by a team

What is pyDARN?

pyDARN

Marina
Schmidt

Introduction

SuperDARN

Software practices

pyDARN

Reading SuperDARN
data

Plotting SuperDARN
data

Timeline

pyDARN

is a **python** library for **SuperDARN** data visualizations.

Reading SuprDARN FITACF file

pyDARN

Software practices

pyDARN

Reading SuperDARN data

Plotting SuperDARN data

Timeline

- Readability - self-documenting code

Reading FITACF file

```
import pydarn
import matplotlib.pyplot as plt
import matplotlib.dates as dates
from datetime import datetime

# Read in SuperDARN FITACF file
darn_read = pydarn.DarnRead("20180220.CO.rkn.fitacf")
data = darn_read.read_fitacf()
```

Timeline

Plotting Range-Time Plots

```

# Create matplotlib figure and axes object
fig, (ax1, ax2) = plt.subplots(2, 1, sharex=True)

# example of dependency injection where the matplotlib
# axes object is being injected into the code to extend
# the ability of matplotlib and utilize the axes object
pydarn.RTP.plot_range_time(data, beam_num=7, parameter='p_1', ax=ax1,
                           boundary=(0, 80),
                           color_bar_label="Signal to Noise\n ($dB$)")

# change the date format to HH:MM
ax2.xaxis.set_major_formatter(dates.DateFormatter('%H:%M'))

#change color map to plasma
pydarn.RTP.plot_range_time(data, beam_num=7, parameter='p_1',
                           color_map='plasma', boundary=(0,80),
                           ax=ax2, color_bar_label="Signal to Noise\n ($dB$)")

ax2.set_ylabel("Range Gates")
ax1.set_ylabel("Range Gates")
ax2.set_xlabel("Date (UTC)")
ax1.set_title("Comparison of Color Scales for Signal to Noise")
plt.show()

```
